

EXERCISE 20.1

PAGE NO: 20.13

1. A flooring tile has the shape of a parallelogram whose base is 24 cm and the corresponding height is 10 cm. How many such tiles are required to cover a floor of area 1080 m²?

Solution:

Given that,

Base of parallelogram = 24cm

Height of parallelogram = 10cm

Area of floor = 1080m²

We know that,

Area of parallelogram = Base × Height

Area of 1 tile = $24 \times 10 = 240\text{cm}^2$

We know that, 1m = 100cm

So for 1080m² = $1080 \times 100 \times 100 \text{ cm}^2$

To calculate the Number of tiles required = Area of floor/Area of 1 tile

i.e., Number of tiles required = $(1080 \times 100 \times 100) / (24 \times 10) = 45000$

∴ Number of tiles required = 45000

2. A plot is in the form of a rectangle ABCD having semi-circle on BC as shown in Fig. 20.23. If AB = 60 m and BC = 28 m, Find the area of the plot.

Fig. 20.23

Solution:

Area of the plot = Area of the rectangle + Area of semi-circle

Radius of semi-circle = $BC/2 = 28/2 = 14\text{m}$

Area of the Rectangular plot = Length × Breadth = $60 \times 28 = 1680 \text{ m}^2$

Area of the Semi-circular portion = $\pi r^2/2$

$$= \frac{1}{2} \times \frac{22}{7} \times 14 \times 14$$

$$= 308 \text{ m}^2$$

∴ The total area of the plot = $1680 + 308 = 1988 \text{ m}^2$

3. A playground has the shape of a rectangle, with two semi-circles on its smaller sides as diameters, added to its outside. If the sides of the rectangle are 36 m and 24.5 m, find the area of the playground. (Take $\pi = 22/7$.)

Solution:

Area of the plot = Area of the Rectangle + 2 $\times$ area of one semi-circle

Radius of semi-circle = $BC/2 = 24.5/2 = 12.25\text{m}$

Area of the Rectangular plot = Length $\times$ Breadth = $36 \times 24.5 = 882\text{ m}^2$

Area of the Semi-circular portions = $2 \times \pi r^2/2$

$= 2 \times 1/2 \times 22/7 \times 12.25 \times 12.25 = 471.625\text{ m}^2$

Area of the plot = $882 + 471.625 = 1353.625\text{ m}^2$

4. A rectangular piece is 20 m long and 15 m wide. From its four corners, quadrants of radii 3.5 m have been cut. Find the area of the remaining part.

Solution:

Area of the plot = Area of the rectangle - 4 $\times$ area of one quadrant

Radius of semi-circle = 3.5 m

Area of four quadrants = area of one circle

Area of the plot = Length $\times$ Breadth - πr^2

$$\begin{aligned}\text{Area of the plot} &= 20 \times 15 - (22/7 \times 3.5 \times 3.5) \\ \text{Area of the plot} &= 300 - 38.5 = 261.5 \text{ m}^2\end{aligned}$$

5. The inside perimeter of a running track (shown in Fig. 20.24) is 400 m. The length of each of the straight portion is 90 m and the ends are semi-circles. If track is everywhere 14 m wide, find the area of the track. Also, find the length of the outer running track.

Fig. 20.24

Solution:

Perimeter of the inner track = $2 \times \text{Length of rectangle} + \text{perimeter of two semi-circular ends}$

Perimeter of the inner track = $\text{Length} + \text{Length} + 2\pi r$

$$400 = 90 + 90 + (2 \times 22/7 \times r)$$

$$(2 \times 22/7 \times r) = 400 - 180$$

$$(2 \times 22/7 \times r) = 220$$

$$44r = 220 \times 7$$

$$44r = 1540$$

$$r = 1540/44 = 35$$

$$r = 35 \text{ m}$$

So, the radius of inner circle = 35 m

Now, let's calculate the radius of outer track

Radius of outer track = Radius of inner track + width of the track

$$\text{Radius of outer track} = 35 + 14 = 49 \text{ m}$$

Length of outer track = $2 \times \text{Length of rectangle} + \text{perimeter of two outer semi-circular ends}$

$$\text{Length of outer track} = 2 \times 90 + 2\pi r$$

$$\text{Length of outer track} = 2 \times 90 + (2 \times 22/7 \times 49)$$

$$\text{Length of outer track} = 180 + 308 = 488$$

So, Length of outer track = 488 m

Area of inner track = Area of inner rectangle + Area of two inner semi-circles

Area of inner track = Length $\times$ Breadth + πr^2

Area of inner track = $90 \times 70 + (22/7 \times 35 \times 35)$

Area of inner track = $6300 + 3850$

So, Area of inner track = 10150 m^2

Area of outer track = Area of outer rectangle + Area of two outer semi-circles

Breadth of outer track = $35 + 35 + 14 + 14 = 98 \text{ m}$

Area of outer track = length $\times$ breadth + πr^2

Area of outer track = $90 \times 98 + (22/7 \times 49 \times 49)$

Area of outer track = $8820 + 7546$

So, Area of outer track = 16366 m^2

Now, let's calculate area of path

Area of path = Area of outer track – Area of inner track

Area of path = $16366 - 10150 = 6216$

So, Area of path = 6216 m^2

6. Find the area of Fig. 20.25, in square cm, correct to one place of decimal. (Take $\pi = 22/7$)

Fig. 20.25

Solution:

Area of the Figure = Area of square + Area of semi-circle – Area of right angled triangle

Area of the Figure = side $\times$ side + $\pi r^2/2 - (1/2 \times \text{base} \times \text{height})$

Area of the Figure = $10 \times 10 + (1/2 \times 22/7 \times 5 \times 5) - (1/2 \times 8 \times 6)$

Area of the Figure = $100 + 39.28 - 24$

Area of the Figure = 115.3

So, Area of the Figure = 115.3 cm^2

7. The diameter of a wheel of a bus is 90 cm which makes 315 revolutions per minute. Determine its speed in kilometres per hour. (Take $\pi = 22/7$)

Solution:

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

Given that, Diameter of a wheel = 90 cm

We know that, Perimeter of wheel = $2\pi r$

Perimeter of wheel = $22/7 \times 90 = 282.857$

So, Perimeter of a wheel = 282.857 cm

Distance covered in 315 revolutions = $282.857 \times 315 = 89099.955$ cm

One km = 100000 cm

Therefore, Distance covered = $89099.955/100000 = 0.89$ km

Speed in km per hour = $0.89 \times 60 = 53.4$ km per hour

8. The area of a rhombus is 240 cm^2 and one of the diagonal is 16 cm. Find another diagonal.

Solution:

Area of rhombus = $1/2 \times d_1 \times d_2$

$240 = 1/2 \times 16 \times d_2$

$240 = 8 \times d_2$

$d_2 = 240/8 = 30$

So, the other diagonal is 30 cm

9. The diagonals of a rhombus are 7.5 cm and 12 cm. Find its area.

Solution:

Area of rhombus = $1/2 \times d_1 \times d_2$

Area of rhombus = $1/2 \times 7.5 \times 12$

Area of rhombus = $6 \times 7.5 = 45$

So, Area of rhombus = 45 cm^2

10. The diagonal of a quadrilateral shaped field is 24 m and the perpendiculars dropped on it from the remaining opposite vertices are 8 m and 13 m. Find the area of the field.

Solution:

Area of quadrilateral = $1/2 \times d_1 \times (p_1 + p_2)$

Area of quadrilateral = $1/2 \times 24 \times (8 + 13)$

Area of quadrilateral = $12 \times 21 = 252$

So, Area of quadrilateral is 252 cm^2

11. Find the area of a rhombus whose side is 6 cm and whose altitude is 4 cm. If one of its diagonals is 8 cm long, find the length of the other diagonal.

Solution:

Given that,

Side of rhombus = 6 cm

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

Altitude of rhombus = 4 cm

Since rhombus is a parallelogram, therefore area of parallelogram = base $\times$ altitude

i.e., Area of parallelogram = $6 \times 4 = 24 \text{ cm}^2$

Area of parallelogram = Area of rhombus

Area of rhombus = $\frac{1}{2} \times d_1 \times d_2$

$24 = \frac{1}{2} \times 8 \times d_2$

$24 = 4 \times d_2$

$d_2 = 24/4 = 6$

So, length of other diagonal of rhombus is 6 cm

12. The floor of a building consists of 3000 tiles which are rhombus shaped and each of its diagonals are 45 cm and 30 cm in length. Find the total cost of polishing the floor, if the cost per m^2 is Rs. 4.

Solution:

We know that,

Area of rhombus = $\frac{1}{2} \times d_1 \times d_2$

Area of rhombus = $\frac{1}{2} \times 45 \times 30$

Area of rhombus = $1350/2 = 675$

So, Area of rhombus = 675 cm^2

$\therefore$ Area of one tile = 675 cm^2

Now, Area of 3000 tiles = $675 \times 3000 = 2025000 \text{ cm}^2$

Area of tiles in $\text{m}^2 = 2025000/10000 = 202.5 \text{ m}^2$

Total cost for polishing the floor = $202.5 \times 4 = \text{Rs } 810$

13. A rectangular grassy plot is 112 m long and 78 m broad. It has gravel path 2.5 m wide all around it on the side. Find the area of the path and the cost of constructing it at Rs. 4.50 per square metre.

Solution:

We know that,

Inner area of rectangle = length $\times$ breadth

Inner area of rectangle = $112 \times 78 = 8736 \text{ m}^2$

Width of path = 2.5 m

Length of outer rectangle = $112 - (2.5 + 2.5) = 107 \text{ m}$

Breadth of outer rectangle = $78 - (2.5 + 2.5) = 73 \text{ m}$

And,

Outer area of rectangle = length $\times$ breadth

Outer area of rectangle = $107 \times 73 = 7811 \text{ m}^2$

Now let's calculate Area of path,

Area of path = Outer area of rectangle – Inner area of rectangle

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

$$\text{Area of path} = 8736 - 7811 = 925 \text{ m}^2$$

Also given that,

$$\text{Cost of construction for } 1 \text{ m}^2 = \text{Rs } 4.50$$

$$\therefore \text{Cost of construction for } 925 \text{ m}^2 = 925 \times 4.50 = \text{Rs } 4162.5$$

14. Find the area of a rhombus, each side of which measures 20 cm and one of whose diagonals is 24 cm.

Solution:

Given that,

Length of side of rhombus = 20 cm

Length of one diagonal = 24 cm

In $\triangle AOB$,

Using Pythagoras theorem:

$$AB^2 = OA^2 + OB^2$$

$$20^2 = 12^2 + OB^2$$

$$OB^2 = 20^2 - 12^2$$

$$OB^2 = 400 - 144$$

$$OB^2 = 256$$

$$OB = 16$$

So, length of the other diameter = $16 \times 2 = 32$ cm

$$\text{Area of rhombus} = \frac{1}{2} \times d_1 \times d_2$$

$$\text{Area of rhombus} = \frac{1}{2} \times 24 \times 32$$

$$\text{Area of rhombus} = 384 \text{ cm}^2$$

15. The length of a side of a square field is 4 m. What will be the altitude of the rhombus, if the area of the rhombus is equal to the square field and one of its diagonals is 2 m?

Solution:

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

Given that,
Length of a side of a square = 4 m
Area of square = side²
Area of square = $4 \times 4 = 16 \text{ m}^2$
We know that,
Area of square = Area of rhombus
So, Area of rhombus = 16 m^2
Area of rhombus = $\frac{1}{2} \times d_1 \times d_2$
 $16 = \frac{1}{2} \times 2 \times d_2$
 $16 = d_2$
 $\therefore$ the diagonal of rhombus = 16 m
In $\triangle AOB$,

Using Pythagoras theorem:

$$AB^2 = OA^2 + OB^2$$

$$AB^2 = 8^2 + 1^2$$

$$AB^2 = 65$$

$$AB = \sqrt{65}$$

Since rhombus is a parallelogram, therefore area of parallelogram = base $\times$ altitude

$$\text{Area of parallelogram} = AB \times DE$$

$$16 = \sqrt{65} \times DE$$

$$DE = 16/\sqrt{65}$$

$$\text{i.e., Altitude of Rhombus} = 16/\sqrt{65} \text{ cm}$$

16. Find the area of the field in the form of a rhombus, if the length of each side be 14 cm and the altitude be 16 cm.

Solution:

Given that,

Side of rhombus = 14 cm

Altitude of rhombus = 16 cm

Since rhombus is a parallelogram, therefore

Area of parallelogram = base $\times$ altitude

Area of parallelogram = $14 \times 16 = 224 \text{ cm}^2$

17. The cost of fencing a square field at 60 paise per metre is Rs. 1200. Find the cost of reaping the field at the rate of 50 paise per 100 sq. metres.

Solution:

Perimeter of square field = Cost of fencing / rate of fencing

Perimeter of square field = $1200/0.6 = 2000$

So, Perimeter of square field = 2000 m

Perimeter of square = $4 \times \text{side}$

Side of square = Perimeter / 4 = $2000/4 = 500$

So, Side of square = 500 m

We know that, Area of square = side^2

Area of square = $500 \times 500 = 250000 \text{ m}^2$

Cost of reaping = $(250000 \times 0.5) / 100 = 1250$

$\therefore$ Cost of reaping the field is Rs 1250

18. In exchange of a square plot one of whose sides is 84 m, a man wants to buy a rectangular plot 144 m long and of the same area as of the square plot. Find the width of the rectangular plot.

Solution:

Area of square = side^2

Area of square = $84 \times 84 = 7056$

Since, Area of square = Area of rectangle

$7056 = 144 \times \text{width}$

Width = $7056/144 = 49$

$\therefore$ Width of rectangle = 49 m

19. The area of a rhombus is 84 m^2 . If its perimeter is 40 m, then find its altitude.

Solution:

Given that,

Area of rhombus = 84 m^2

Perimeter = 40 m

We know that,

Perimeter of rhombus = $4 \times \text{side}$

$\therefore$ Side of rhombus = Perimeter / 4 = $40/4 = 10$

So, Side of rhombus = 10 m

Since rhombus is a parallelogram, therefore Area of parallelogram = base $\times$ altitude

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

$$84 = 10 \times \text{altitude}$$

$$\text{Altitude} = 84/10 = 8.4$$

$$\text{So, Altitude of rhombus} = 8.4 \text{ m}$$

20. A garden is in the form of a rhombus whose side is 30 metres and the corresponding altitude is 16 m. Find the cost of levelling the garden at the rate of Rs. 2 per m².

Solution:

Given that,

$$\text{Side of rhombus} = 30 \text{ m}$$

$$\text{Altitude of rhombus} = 16 \text{ m}$$

Since rhombus is a parallelogram, therefore Area of parallelogram = base $\times$ altitude

$$\text{Area of parallelogram} = 30 \times 16 = 480 \text{ m}^2$$

$$\text{Cost of levelling the garden} = \text{area} \times \text{rate}$$

$$\text{Cost of levelling the garden} = 480 \times 2 = 960$$

So, Cost of levelling the garden is Rs 960

21. A field in the form of a rhombus has each side of length 64 m and altitude 16 m. What is the side of a square field which has the same area as that of a rhombus?

Solution:

Given that,

$$\text{Side of rhombus} = 64 \text{ m}$$

$$\text{Altitude of rhombus} = 16 \text{ m}$$

Since rhombus is a parallelogram, therefore Area of parallelogram = base $\times$ altitude

$$\text{Area of parallelogram} = 64 \times 16 = 1024 \text{ m}^2$$

Since Area of rhombus = Area of square

$$\text{Therefore, Area of square} = \text{side}^2$$

$$\text{Or side}^2 = \text{Area of square}$$

$$\text{Side of a square} = \sqrt{\text{square}}$$

$$\text{Side of square} = \sqrt{1024} = 32$$

$$\therefore \text{Side of square} = 32 \text{ m}$$

22. The area of a rhombus is equal to the area of a triangle whose base and the corresponding altitude are 24.8 cm and 16.5 cm respectively. If one of the diagonals of the rhombus is 22 cm, find the length of the other diagonal.

Solution:

Given that,

$$\text{Length of base of triangle} = 24.8 \text{ cm}$$

$$\text{Length of altitude of triangle} = 16.5 \text{ cm}$$

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

$\therefore$ Area of triangle = $\frac{1}{2} \times \text{base} \times \text{altitude}$
Area of triangle = $\frac{1}{2} \times 24.8 \times 16.5 = 204.6$
So, Area of triangle = 204.6 cm
Since, Area of triangle = Area of rhombus
 $\therefore$ Area of rhombus = $\frac{1}{2} \times d_1 \times d_2$
 $204.6 = \frac{1}{2} \times 22 \times d_2$
 $204.6 = 11 \times d_2$
 $d_2 = 204.6/11 = 18.6$
 $\therefore$ The length of other diagonal is 18.6 cm

EXERCISE 20.2

PAGE NO: 20.22

1. Find the area, in square metres, of the trapezium whose bases and altitudes are as under:

(i) bases = 12 dm and 20 dm, altitude = 10 dm

(ii) bases = 28 cm and 3 dm, altitude = 25 cm

(iii) bases = 8 m and 60 dm, altitude = 40 dm

(iv) bases = 150 cm and 30 dm, altitude = 9 dm

Solution:

(i) Given that,

Length of bases of trapezium = 12 dm and 20 dm

Length of altitude = 10 dm

We know that, 10 dm = 1 m

$\therefore$ Length of bases in m = 1.2 m and 2 m

Similarly, length of altitude in m = 1 m

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude

Area of trapezium = $\frac{1}{2} (1.2 + 2.0) \times 1$

Area of trapezium = $\frac{1}{2} \times 3.2 = 1.6$

So, Area of trapezium = 1.6m^2

(ii) Given that,

Length of bases of trapezium = 28 cm and 3 dm

Length of altitude = 25 cm

We know that, 10 dm = 1 m

$\therefore$ Length of bases in m = 0.28 m and 0.3 m

Similarly, length of altitude in m = 0.25 m

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude

Area of trapezium = $\frac{1}{2} (0.28 + 0.3) \times 0.25$

Area of trapezium = $\frac{1}{2} \times 0.58 \times 0.25 = 0.0725$

So, Area of trapezium = 0.0725m^2

(iii) Given that,

Length of bases of trapezium = 8 m and 60 dm

Length of altitude = 40 dm

We know that, 10 dm = 1 m

$\therefore$ Length of bases in m = 8 m and 6 m

Similarly, length of altitude in m = 4 m

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude

Area of trapezium = $\frac{1}{2} (8 + 6) \times 4$

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

$$\text{Area of trapezium} = \frac{1}{2} \times 56 = 28$$

$$\text{So, Area of trapezium} = 28\text{m}^2$$

(iv) Given that,

Length of bases of trapezium = 150 cm and 30 dm

Length of altitude = 9 dm

We know that, 10 dm = 1 m

$\therefore$ Length of bases in m = 1.5 m and 3 m

Similarly, length of altitude in m = 0.9 m

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude

$$\text{Area of trapezium} = \frac{1}{2} (1.5 + 3) \times 0.9$$

$$\text{Area of trapezium} = \frac{1}{2} \times 4.5 \times 0.9 = 2.025$$

$$\text{So, Area of trapezium} = 2.025\text{m}^2$$

2. Find the area of trapezium with base 15 cm and height 8 cm, if the side parallel to the given base is 9 cm long.

Solution:

Given that,

Length of bases of trapezium = 15 cm and 9 cm

Length of altitude = 8 cm

We know that,

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude

$$\text{Area of trapezium} = \frac{1}{2} (15 + 9) \times 8$$

$$\text{Area of trapezium} = \frac{1}{2} \times 192 = 96$$

$$\text{So, Area of trapezium} = 96\text{m}^2$$

3. Find the area of a trapezium whose parallel sides are of length 16 dm and 22 dm and whose height is 12 dm.

Solution:

Given that,

Length of bases of trapezium = 16 dm and 22 dm

Length of altitude = 12 dm

We know that, 10 dm = 1 m

$\therefore$ Length of bases in m = 1.6 m and 2.2 m

Similarly, length of altitude in m = 1.2 m

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude

$$\text{Area of trapezium} = \frac{1}{2} (1.6 + 2.2) \times 1.2$$

$$\text{Area of trapezium} = \frac{1}{2} \times 3.8 \times 1.2 = 2.28$$

$$\text{So, Area of trapezium} = 2.28\text{m}^2$$

4. Find the height of a trapezium, the sum of the lengths of whose bases (parallel sides) is 60 cm and whose area is 600 cm².

Solution:

Given that,

Length of bases of trapezium = 60 cm

Area = 600 cm²

We know that,

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude

$600 = \frac{1}{2} (60) \times \text{altitude}$

$600 = 30 \times \text{altitude}$

Which implies, altitude = $600/30 = 20$

$\therefore$ Length of altitude is 20 cm

5. Find the altitude of a trapezium whose area is 65 cm² and whose base are 13 cm and 26 cm.

Solution:

Given that,

Length of bases of trapezium = 13 cm and 26 cm

Area = 65 cm²

We know that,

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude

$65 = \frac{1}{2} (13 + 26) \times \text{altitude}$

$65 = \frac{39}{2} \times \text{altitude}$

Which implies, altitude = $(65 \times 2) / 39 = 130/39 = 10/3$

$\therefore$ Length of altitude = $10/3$ cm

6. Find the sum of the lengths of the bases of a trapezium whose area is 4.2 m² and whose height is 280 cm.

Solution:

Given that,

Height of trapezium = 280 cm = 2.8m

Area = 4.2 m²

We know that,

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude

To calculate the length of parallel sides we can rewrite the above equation as,

Sum of lengths of parallel sides = $(2 \times \text{Area}) / \text{altitude}$

Sum of lengths of parallel sides = $(2 \times 4.2) / 2.8 = 8.4/2.8 = 3$

$\therefore$ Sum of lengths of parallel sides = 3 m

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

7. Find the area of a trapezium whose parallel sides of lengths 10 cm and 15 cm are at a distance of 6 cm from each other. Calculate this area as,
(i) the sum of the areas of two triangles and one rectangle.
(ii) the difference of the area of a rectangle and the sum of the areas of two triangles.
Solution:

We know that, Area of a trapezium ABCD
= area ($\triangle DFA$) + area (rectangle DFEC) + area ($\triangle CEB$)
= $(\frac{1}{2} \times AF \times DF) + (FE \times DF) + (\frac{1}{2} \times EB \times CE)$
= $(\frac{1}{2} \times AF \times h) + (FE \times h) + (\frac{1}{2} \times EB \times h)$
= $\frac{1}{2} \times h \times (AF + 2FE + EB)$
= $\frac{1}{2} \times h \times (AF + FE + EB + FE)$
= $\frac{1}{2} \times h \times (AB + FE)$
= $\frac{1}{2} \times h \times (AB + CD)$ [Opposite sides of rectangle are equal]
= $\frac{1}{2} \times 6 \times (15 + 10)$
= $\frac{1}{2} \times 6 \times 25 = 75$
 $\therefore$ Area of trapezium = 75 cm^2

8. The area of a trapezium is 960 cm^2 . If the parallel sides are 34 cm and 46 cm, find the distance between them.

Solution:

We know that,

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ distance between parallel sides

i.e., Area of trapezium = $\frac{1}{2}$ (Sum of sides) $\times$ distance between parallel sides

To calculate the distance between parallel sides we can rewrite the above equation as,

Distance between parallel sides = $(2 \times \text{Area}) / \text{Sum of sides}$

$$= (2 \times 960) / (34 + 46)$$

$$= (2 \times 960) / 80 = 1920/80 = 24$$

$\therefore$ Distance between parallel sides = 24 cm

9. Find the area of Fig. 20.35 as the sum of the areas of two trapezium and a rectangle.

Solution:

From the figure we can write,

Area of figure = Area of two trapeziums + Area of rectangle

Given that,

Length of rectangle = 50 cm

Breadth of rectangle = 10 cm

Length of parallel sides of trapezium = 30 cm and 10 cm

Distance between parallel sides of trapezium = $(70-50)/2 = 20/2 = 10$

So, Distance between parallel sides of trapezium = 10 cm

Area of figure = $2 \times \frac{1}{2} (\text{Sum of lengths of parallel sides}) \times \text{altitude} + \text{Length} \times \text{Breadth}$

Area of figure = $2 \times \frac{1}{2} (30+10) \times 10 + 50 \times 10$

Area of figure = $40 \times 10 + 50 \times 10$

Area of figure = $400 + 500 = 900$

$\therefore$ Area of figure = 900 cm^2

10. Top surface of a table is trapezium in shape. Find its area if its parallel sides are 1 m and 1.2 m and perpendicular distance between them is 0.8 m.

Fig. 20.36

Solution:

Given that,

Length of parallel sides of trapezium = 1.2m and 1m

Distance between parallel sides of trapezium = 0.8m

We know that,

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ distance between parallel sides

i.e., Area of trapezium = $\frac{1}{2}$ (Sum of sides) $\times$ distance between parallel sides

Area of trapezium = $\frac{1}{2}$ (1.2 + 1) $\times$ 0.8

Area of trapezium = $\frac{1}{2} \times 2.2 \times 0.8 = 0.88$

So, Area of trapezium = 0.88m²

11. The cross-section of a canal is a trapezium in shape. If the canal is 10 m wide at the top 6 m wide at the bottom and the area of cross-section is 72 m² determine its depth.

Solution:

Given that,

Length of parallel sides of trapezium = 10m and 6m

Area = 72 m²

Let the distance between parallel sides of trapezium = x meter

We know that,

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ distance between parallel sides

i.e., Area of trapezium = $\frac{1}{2}$ (Sum of sides) $\times$ distance between parallel sides

$$72 = \frac{1}{2} (10 + 6) \times x$$

$$72 = 8 \times x$$

$$x = 72/8 = 9$$

$\therefore$ The depth is 9m.

12. The area of a trapezium is 91 cm^2 and its height is 7 cm. If one of the parallel sides is longer than the other by 8 cm, find the two parallel sides.

Solution:

Given that,

Let the length of one parallel side of trapezium = x meter

Length of other parallel side of trapezium = $(x+8)$ meter

Area of trapezium = 91 cm^2

Height = 7 cm

We know that,

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude

$$91 = \frac{1}{2} (x+x+8) \times 7$$

$$91 = \frac{1}{2} (2x+8) \times 7$$

$$91 = (x+4) \times 7$$

$$(x+4) = 91/7$$

$$x+4 = 13$$

$$x = 13 - 4$$

$$x = 9$$

$\therefore$ Length of one parallel side of trapezium = 9 cm

And, Length of other parallel side of trapezium = $x+8 = 9+8 = 17 \text{ cm}$

13. The area of a trapezium is 384 cm^2 . Its parallel sides are in the ratio 3:5 and the perpendicular distance between them is 12 cm. Find the length of each one of the parallel sides.

Solution:

Given that,

Let the length of one parallel side of trapezium = $3x$ meter

Length of other parallel side of trapezium = $5x$ meter

Area of trapezium = 384 cm^2

Distance between parallel sides = 12 cm

We know that,

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ distance between parallel sides

i.e., Area of trapezium = $\frac{1}{2}$ (Sum of sides) $\times$ distance between parallel sides

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

$$384 = \frac{1}{2} (3x + 5x) \times 12$$

$$384 = \frac{1}{2} (8x) \times 12$$

$$4x = 384/12$$

$$4x = 32$$

$$x = 8$$

$$\therefore \text{Length of one parallel side of trapezium} = 3x = 3 \times 8 = 24 \text{ cm}$$

$$\text{And, Length of other parallel side of trapezium} = 5x = 5 \times 8 = 40 \text{ cm}$$

14. Mohan wants to buy a trapezium shaped field. Its side along the river is parallel and twice the side along the road. If the area of this field is 10500 m^2 and the perpendicular distance between the two parallel sides is 100 m , find the length of the side along the river.

Fig. 20.37

Solution:

Given that,

Let the length of side of trapezium shaped field along road = x meter

Length of other side of trapezium shaped field along road = $2x$ meter

Area of trapezium = 10500 cm^2

Distance between parallel sides = 100 m

We know that,

Area of trapezium = $\frac{1}{2} (\text{Sum of lengths of parallel sides}) \times \text{distance between parallel sides}$

i.e., Area of trapezium = $\frac{1}{2} (\text{Sum of sides}) \times \text{distance between parallel sides}$

$$10500 = \frac{1}{2} (x + 2x) \times 100$$

$$10500 = \frac{1}{2} (3x) \times 100$$

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

$$3x = 10500/50$$

$$3x = 210$$

$$x = 210/3 = 70$$

$$x = 70$$

∴ Length of side of trapezium shaped field along road = 70 m

And, Length of other side of trapezium shaped field along road = $2x = 70 \times 2 = 140$ m

15. The area of a trapezium is 1586 cm^2 and the distance between the parallel sides is 26 cm. If one of the parallel sides is 38 cm, find the other.

Solution:

Given that,

Let the length of other parallel side of trapezium = x cm

Length of one parallel side of trapezium = 38 cm

Area of trapezium = 1586 cm^2

Distance between parallel sides = 26 cm

We know that,

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ distance between parallel sides

i.e., Area of trapezium = $\frac{1}{2}$ (Sum of sides) $\times$ distance between parallel sides

$$1586 = \frac{1}{2} (x + 38) \times 26$$

$$1586 = (x + 38) \times 13$$

$$(x + 38) = 1586/13$$

$$x = 122 - 38$$

$$x = 84$$

∴ Length of the other parallel side of trapezium = 84 cm

16. The parallel sides of a trapezium are 25 cm and 13 cm; its nonparallel sides are equal, each being 10 cm, find the area of the trapezium.

Solution:

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

In $\triangle CEF$,

$CE = 10$ cm and $EF = 6$ cm

Using Pythagoras theorem:

$$CE^2 = CF^2 + EF^2$$

$$CF^2 = CE^2 - EF^2$$

$$CF^2 = 10^2 - 6^2$$

$$CF^2 = 100 - 36$$

$$CF^2 = 64$$

$$CF = 8$$
 cm

From the figure we can write,

Area of trapezium = Area of parallelogram AECD + Area of area of triangle CEF

Area of trapezium = base $\times$ height + $\frac{1}{2}$ (base $\times$ height)

$$\text{Area of trapezium} = 13 \times 8 + \frac{1}{2} (12 \times 8)$$

$$\text{Area of trapezium} = 104 + 48 = 152$$

$$\therefore \text{Area of trapezium} = 152 \text{ cm}^2$$

17. Find the area of a trapezium whose parallel sides are 25 cm, 13 cm and the other sides are 15 cm each.

Solution:

In $\triangle CEF$,

$CE = 10$ cm and $EF = 6$ cm

Using Pythagoras theorem:

$$CE^2 = CF^2 + EF^2$$

$$CF^2 = CE^2 - EF^2$$

$$CF^2 = 15^2 - 6^2$$

$$CF^2 = 225 - 36$$

$$CF^2 = 189$$

$$CF = \sqrt{189}$$

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

$$= \sqrt{9 \times 21}$$
$$= 3\sqrt{21} \text{ cm}$$

From the figure we can write,

Area of trapezium = Area of parallelogram AECD + Area of area of triangle CEF

Area of trapezium = height $\times$ $\frac{1}{2}$ (sum of parallel sides)

Area of trapezium = $3\sqrt{21} \times \frac{1}{2} (25 + 13)$

Area of trapezium = $3\sqrt{21} \times 19 = 57\sqrt{21}$

$\therefore$ Area of trapezium = $57\sqrt{21} \text{ cm}^2$

18. If the area of a trapezium is 28 cm^2 and one of its parallel sides is 6 cm, find the other parallel side if its altitude is 4 cm.

Solution:

Given that,

Let the length of other parallel side of trapezium = $x \text{ cm}$

Length of one parallel side of trapezium = 6 cm

Area of trapezium = 28 cm^2

Length of altitude of trapezium = 4 cm

We know that,

Area of trapezium = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ distance between parallel sides

i.e., Area of trapezium = $\frac{1}{2}$ (Sum of sides) $\times$ distance between parallel sides

$$28 = \frac{1}{2} (6 + x) \times 4$$

$$28 = (6 + x) \times 2$$

$$(6 + x) = 28/2$$

$$(6 + x) = 14$$

$$x = 14 - 6$$

$$x = 8$$

$\therefore$ Length of the other parallel side of trapezium = 8 cm

19. In Fig. 20.38, a parallelogram is drawn in a trapezium, the area of the parallelogram is 80 cm^2 , find the area of the trapezium.

Fig. 20.38

Solution:

In $\triangle CEF$, $CE = 10$ cm and $EF = 6$ cm

Using Pythagoras theorem:

$$CE^2 = CF^2 + EF^2$$

$$CF^2 = CE^2 - EF^2$$

$$CF^2 = 10^2 - 6^2$$

$$CF^2 = 100 - 36$$

$$CF^2 = 64$$

$$CF = 8$$
 cm

Area of parallelogram = 80 cm²

From the figure we can write,

Area of trapezium = Area of parallelogram AECD + Area of area of triangle CEF

Area of trapezium = $\text{base} \times \text{height} + \frac{1}{2} (\text{base} \times \text{height})$

$$\text{Area of trapezium} = 10 \times 8 + \frac{1}{2} (12 \times 8)$$

$$\text{Area of trapezium} = 80 + 48 = 128$$

$$\therefore \text{Area of trapezium} = 128 \text{ cm}^2$$

20. Find the area of the field shown in Fig. 20.39 by dividing it into a square, a rectangle and a trapezium.

Fig. 20.39

Solution:

RD Sharma Solutions for Class 8 Maths Chapter 20 –
Mensuration – I (Area of a Trapezium and a Polygon)

From the figure we can write,

Area of given figure = Area of square ABCD + Area of rectangle DEFG + Area of rectangle GHJI + Area of triangle FHI

i.e., Area of given figure = side $\times$ side + length $\times$ breadth + length $\times$ breadth + $\frac{1}{2} \times$ base $\times$ altitude

Area of given figure = $4 \times 4 + 8 \times 4 + 3 \times 4 + \frac{1}{2} \times 5 \times 5$

Area of given figure = $16 + 32 + 12 + 10 = 70$

$\therefore$ Area of given figure = 70 cm^2

EXERCISE 20.3

PAGE NO: 20.28

1. Find the area of the pentagon shown in fig. 20.48, if $AD = 10$ cm, $AG = 8$ cm, $AH = 6$ cm, $AF = 5$ cm, $BF = 5$ cm, $CG = 7$ cm and $EH = 3$ cm.

Fig. 20.48

Solution:

$$GH = AG - AH = 8 - 6 = 2 \text{ cm}$$

$$HF = AH - AF = 6 - 5 = 1 \text{ cm}$$

$$GD = AD - AG = 10 - 8 = 2 \text{ cm}$$

From the figure we can write,

Area of given figure = Area of triangle AFB + Area of trapezium BCGF + Area of triangle CGD + Area of triangle AHE + Area of triangle EGD

We know that,

Area of right angled triangle = $\frac{1}{2} \times \text{base} \times \text{altitude}$

Area of trapezium = $\frac{1}{2} (\text{Sum of lengths of parallel sides}) \times \text{altitude}$

$$\text{Area of given pentagon} = \frac{1}{2} \times AF \times BF + \frac{1}{2} (CG + BF) \times FG + \frac{1}{2} \times GD \times CG + \frac{1}{2} \times AH \times EH + \frac{1}{2} \times HD \times EH$$

$$\text{Area of given pentagon} = \frac{1}{2} \times 5 \times 5 + \frac{1}{2} (7 + 5) \times 3 + \frac{1}{2} \times 2 \times 7 + \frac{1}{2} \times 6 \times 3 + \frac{1}{2} \times 4 \times 3$$

$$\text{Area of given pentagon} = 12.5 + 18 + 7 + 9 + 6 = 52.5$$

$$\therefore \text{Area of given pentagon} = 52.5 \text{ cm}^2$$

2. Find the area enclosed by each of the following figures [fig. 20.49 (i)-(ii)] as the sum of the areas of a rectangle and a trapezium.

RD Sharma Solutions for Class 8 Maths Chapter 20 – Mensuration – I (Area of a Trapezium and a Polygon)

Fig. 20.49

Solution:**Figure (i)**

From the figure we can write,

Area of figure = Area of trapezium + Area of rectangle

Area of figure = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude + Length $\times$ Breadth

Area of figure = $\frac{1}{2} (18 + 7) \times 8 + 18 \times 18$

Area of figure = $\frac{1}{2} (25) \times 8 + 18 \times 18$

Area of figure = $100 + 324 = 424$

$\therefore$ Area of figure is 424 cm^2

Figure (ii)

From the figure we can write,

Area of figure = Area of trapezium + Area of rectangle

Area of figure = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude + Length $\times$ Breadth

Area of given figure = $\frac{1}{2} (15 + 6) \times 8 + 15 \times 20$

Area of given figure = $84 + 300 = 384$

$\therefore$ Area of figure is 384 cm^2

Figure (iii)

Using Pythagoras theorem in the right angled triangle,

$$5^2 = 4^2 + x^2$$

$$x^2 = 25 - 16$$

$$x^2 = 9$$

$$x = 3 \text{ cm}$$

From the figure we can write,

Area of figure = Area of trapezium + Area of rectangle

Area of figure = $\frac{1}{2}$ (Sum of lengths of parallel sides) $\times$ altitude + Length $\times$ Breadth

$$\text{Area of given figure} = \frac{1}{2} (14 + 6) \times 3 + 4 \times 6$$

$$\text{Area of given figure} = 30 + 24 = 54$$

$$\therefore \text{Area of figure is } 54 \text{ cm}^2$$

3. There is a pentagonal shaped park as shown in Fig. 20.50. Jyoti and Kavita divided it in two different ways.

Find the area of this park using both ways. Can you suggest some another way of finding its area?

Fig. 20.50

Solution:

From the figure we can write,

Area of figure = Area of trapezium + Area of rectangle

Area of Jyoti's diagram = $2 \times \frac{1}{2} (\text{Sum of lengths of parallel sides}) \times \text{altitude}$

$$\text{Area of figure} = 2 \times \frac{1}{2} \times (15 + 30) \times 7.5$$

$$\text{Area of figure} = 45 \times 7.5 = 337.5$$

$$\text{Therefore, Area of figure} = 337.5 \text{ cm}^2$$

We also know that,

Area of Pentagon = Area of triangle + area of rectangle

$$\text{Area of Pentagon} = \frac{1}{2} \times \text{Base} \times \text{Altitude} + \text{Length} \times \text{Breadth}$$

$$\text{Area of Pentagon} = \frac{1}{2} \times 15 \times 15 + 15 \times 15$$

$$\text{Area of Pentagon} = 112.5 + 225 = 337.5$$

$$\therefore \text{Area of pentagon is } 337.5 \text{ m}^2$$

4. Find the area of the following polygon, if AL = 10 cm, AM = 20 cm, AN = 50 cm. AO = 60 cm and AD = 90 cm.

Fig. 20.51

Solution:

Given that,

AL = 10 cm; AM = 20 cm; AN = 50 cm; AO = 60 cm; AD = 90 cm

LM = AM – AL = 20 – 10 = 10 cm

MN = AN – AM = 50 – 20 = 30 cm

OD = AD – AO = 90 – 60 = 30 cm

ON = AO – AN = 60 – 50 = 10 cm

DN = OD + ON = 30 + 10 = 40 cm

OM = MN + ON = 30 + 10 = 40 cm

LN = LM + MN = 10 + 30 = 40 cm

From the figure we can write,

Area of figure = Area of triangle AMF + Area of trapezium FMNE + Area of triangle END + Area of triangle ALB + Area of trapezium LBCN + Area of triangle DNC

We know that,

Area of right angled triangle = $\frac{1}{2} \times \text{base} \times \text{altitude}$

Area of trapezium = $\frac{1}{2} (\text{Sum of lengths of parallel sides}) \times \text{altitude}$

Area of given hexagon = $\frac{1}{2} \times \text{AM} \times \text{FM} + \frac{1}{2} (\text{MF} + \text{OE}) \times \text{OM} + \frac{1}{2} \times \text{OD} \times \text{OE} + \frac{1}{2} \times \text{AL} \times \text{BL} + \frac{1}{2} \times (\text{BL} + \text{CN}) \times \text{LN} + \frac{1}{2} \times \text{DN} \times \text{CN}$

Area of given hexagon = $\frac{1}{2} \times 20 \times 20 + \frac{1}{2} (20 + 60) \times 40 + \frac{1}{2} \times 30 \times 60 + \frac{1}{2} \times 10 \times 30 + \frac{1}{2} \times (30 + 40) \times 40 + \frac{1}{2} \times 40 \times 40$

Area of given hexagon = $200 + 1600 + 900 + 150 + 1400 + 800 = 5050$

$\therefore$ Area of given hexagon is 5050 cm^2

5. Find the area of the following regular hexagon.

**Solution:**

Given that,

$$NQ = 23 \text{ cm}$$

$$ND + QC = 23 - 13 = 10$$

$$ND = QC = 5 \text{ cm}$$

$$OM = 24 \text{ cm}$$

Area of given hexagon = 2 times Area of triangle MNO + Area of rectangle MOPR

Area of right angled triangle = $\frac{1}{2} \times \text{base} \times \text{altitude}$

Area of rectangle = length $\times$ breadth

$$\text{Area of regular hexagon} = \frac{1}{2} \times OM \times ND + MO \times OP + \frac{1}{2} \times RP \times QC$$

$$\text{Area of regular hexagon} = \frac{1}{2} \times 24 \times 5 + 24 \times 13 + \frac{1}{2} \times 24 \times 5$$

$$\text{Area of given hexagon} = \frac{1}{2} \times 120 + 312 + \frac{1}{2} \times 120 = 432$$

$\therefore$ Area of given hexagon is 432 cm^2
