

EXERCISE 3.1**PAGE NO: 3.7****1. Define a function as a set of ordered pairs.****Solution:**

Let A and B be two non-empty sets. A relation from A to B, i.e., a subset of $A \times B$, is called a function (or a mapping) from A to B, if

- (i) for each $a \in A$ there exists $b \in B$ such that $(a, b) \in f$
- (ii) $(a, b) \in f$ and $(a, c) \in f \Rightarrow b = c$

2. Define a function as a correspondence between two sets.**Solution:**

Let A and B be two non-empty sets. Then a function 'f' from set A to B is a rule or method or correspondence which associates elements of set A to elements of set B such that:

- (i) all elements of set A are associated to elements in set B.
- (ii) an element of set A is associated to a unique element in set B.

3. What is the fundamental difference between a relation and a function? Is every relation a function?**Solution:**

Let 'f' be a function and R be a relation defined from set X to set Y.

The domain of the relation R might be a subset of the set X, but the domain of the function f must be equal to X. This is because each element of the domain of a function must have an element associated with it, whereas this is not necessary for a relation.

In relation, one element of X might be associated with one or more elements of Y, while it must be associated with only one element of Y in a function.

Thus, not every relation is a function. However, every function is necessarily a relation.

4. Let $A = \{-2, -1, 0, 1, 2\}$ and $f: A \rightarrow Z$ be a function defined by $f(x) = x^2 - 2x - 3$.**Find:**

- (i) range of f i.e. $f(A)$
- (ii) pre-images of 6, -3 and 5

Solution:

Given:

$$A = \{-2, -1, 0, 1, 2\}$$

$$f: A \rightarrow Z \text{ such that } f(x) = x^2 - 2x - 3$$

(i) Range of f i.e. $f(A)$

A is the domain of the function f . Hence, range is the set of elements $f(x)$ for all $x \in A$.

Substituting $x = -2$ in $f(x)$, we get

$$\begin{aligned}f(-2) &= (-2)^2 - 2(-2) - 3 \\&= 4 + 4 - 3 \\&= 5\end{aligned}$$

Substituting $x = -1$ in $f(x)$, we get

$$\begin{aligned}f(-1) &= (-1)^2 - 2(-1) - 3 \\&= 1 + 2 - 3 \\&= 0\end{aligned}$$

Substituting $x = 0$ in $f(x)$, we get

$$\begin{aligned}f(0) &= (0)^2 - 2(0) - 3 \\&= 0 - 0 - 3 \\&= -3\end{aligned}$$

Substituting $x = 1$ in $f(x)$, we get

$$\begin{aligned}f(1) &= 1^2 - 2(1) - 3 \\&= 1 - 2 - 3 \\&= -4\end{aligned}$$

Substituting $x = 2$ in $f(x)$, we get

$$\begin{aligned}f(2) &= 2^2 - 2(2) - 3 \\&= 4 - 4 - 3 \\&= -3\end{aligned}$$

Thus, the range of f is $\{-4, -3, 0, 5\}$.

(ii) pre-images of 6, -3 and 5

Let x be the pre-image of 6 $\Rightarrow f(x) = 6$

$$x^2 - 2x - 3 = 6$$

$$x^2 - 2x - 9 = 0$$

$$x = \frac{-(-2) \pm \sqrt{((-2)^2 - 4(1)(-9))}}{2(1)}$$

$$= \frac{2 \pm \sqrt{4+36}}{2}$$

$$= \frac{2 \pm \sqrt{40}}{2}$$

$$= 1 \pm \sqrt{10}$$

However, $1 \pm \sqrt{10} \notin A$

Thus, there exists no pre-image of 6.

Now, let x be the pre-image of -3 $\Rightarrow f(x) = -3$

$$x^2 - 2x - 3 = -3$$

$$x^2 - 2x = 0$$

$$x(x - 2) = 0$$

$$x = 0 \text{ or } 2$$

Clearly, both 0 and 2 are elements of A.

Thus, 0 and 2 are the pre-images of -3.

Now, let x be the pre-image of 5 $\Rightarrow f(x) = 5$

$$x^2 - 2x - 3 = 5$$

$$x^2 - 2x - 8 = 0$$

$$x^2 - 4x + 2x - 8 = 0$$

$$x(x - 4) + 2(x - 4) = 0$$

$$(x + 2)(x - 4) = 0$$

$$x = -2 \text{ or } 4$$

However, $4 \notin A$ but $-2 \in A$

Thus, -2 is the pre-images of 5.

$\therefore \emptyset, \{0, 2\}, -2$ are the pre-images of 6, -3, 5

5. If a function $f: \mathbb{R} \rightarrow \mathbb{R}$ be defined by

$$f(x) = \begin{cases} 3x - 2, & x < 0 \\ 1, & x = 0 \\ 4x + 1, & x > 0 \end{cases}$$

Find: $f(1), f(-1), f(0), f(2)$.

Solution:

Given:

Let us find $f(1), f(-1), f(0)$ and $f(2)$.

When $x > 0$, $f(x) = 4x + 1$

Substituting $x = 1$ in the above equation, we get

$$\begin{aligned} f(1) &= 4(1) + 1 \\ &= 4 + 1 \\ &= 5 \end{aligned}$$

When $x < 0$, $f(x) = 3x - 2$

Substituting $x = -1$ in the above equation, we get

$$\begin{aligned} f(-1) &= 3(-1) - 2 \\ &= -3 - 2 \\ &= -5 \end{aligned}$$

When $x = 0$, $f(x) = 1$

Substituting $x = 0$ in the above equation, we get

$$f(0) = 1$$

When $x > 0$, $f(x) = 4x + 1$

Substituting $x = 2$ in the above equation, we get

$$f(2) = 4(2) + 1$$

$$= 8 + 1$$

$$= 9$$

$$\therefore f(1) = 5, f(-1) = -5, f(0) = 1 \text{ and } f(2) = 9.$$

6. A function $f: \mathbf{R} \rightarrow \mathbf{R}$ is defined by $f(x) = x^2$. Determine

(i) range of f

(ii) $\{x: f(x) = 4\}$

(iii) $\{y: f(y) = -1\}$

Solution:

Given:

$$f: \mathbf{R} \rightarrow \mathbf{R} \text{ and } f(x) = x^2.$$

(i) range of f

Domain of $f = \mathbf{R}$ (set of real numbers)

We know that the square of a real number is always positive or equal to zero.

$$\therefore \text{range of } f = \mathbf{R}^+ \cup \{0\}$$

(ii) $\{x: f(x) = 4\}$

Given:

$$f(x) = 4$$

$$\text{we know, } x^2 = 4$$

$$x^2 - 4 = 0$$

$$(x - 2)(x + 2) = 0$$

$$\therefore x = \pm 2$$

$$\therefore \{x: f(x) = 4\} = \{-2, 2\}$$

(iii) $\{y: f(y) = -1\}$

Given:

$$f(y) = -1$$

$$y^2 = -1$$

However, the domain of f is \mathbf{R} , and for every real number y , the value of y^2 is non-negative.

Hence, there exists no real y for which $y^2 = -1$.

$$\therefore \{y: f(y) = -1\} = \emptyset$$

7. Let $f: \mathbf{R}^+ \rightarrow \mathbf{R}$, where \mathbf{R}^+ is the set of all positive real numbers, be such that $f(x) =$

$\log_e x$. Determine**(i) the image set of the domain of f** **(ii) $\{x: f(x) = -2\}$** **(iii) whether $f(xy) = f(x) + f(y)$ holds.****Solution:**Given $f: \mathbb{R}^+ \rightarrow \mathbb{R}$ and $f(x) = \log_e x$.**(i) the image set of the domain of f** Domain of $f = \mathbb{R}^+$ (set of positive real numbers)We know the value of logarithm to the base e (natural logarithm) can take all possible real values. \therefore The image set of $f = \mathbb{R}$ **(ii) $\{x: f(x) = -2\}$** Given $f(x) = -2$ $\log_e x = -2$ $\therefore x = e^{-2}$ [since, $\log_b a = c \Rightarrow a = b^c$] $\therefore \{x: f(x) = -2\} = \{e^{-2}\}$ **(iii) Whether $f(xy) = f(x) + f(y)$ holds.**We have $f(x) = \log_e x \Rightarrow f(y) = \log_e y$ Now, let us consider $f(xy)$ $f(xy) = \log_e(xy)$ $f(xy) = \log_e(x \times y)$ [since, $\log_b(a \times c) = \log_b a + \log_b c$] $f(xy) = \log_e x + \log_e y$ $f(xy) = f(x) + f(y)$ \therefore the equation $f(xy) = f(x) + f(y)$ holds.**8. Write the following relations as sets of ordered pairs and find which of them are functions:****(i) $\{(x, y): y = 3x, x \in \{1, 2, 3\}, y \in \{3, 6, 9, 12\}\}$** **(ii) $\{(x, y): y > x + 1, x = 1, 2 \text{ and } y = 2, 4, 6\}$** **(iii) $\{(x, y): x + y = 3, x, y \in \{0, 1, 2, 3\}\}$** **Solution:****(i) $\{(x, y): y = 3x, x \in \{1, 2, 3\}, y \in \{3, 6, 9, 12\}\}$** When $x = 1$, $y = 3(1) = 3$ When $x = 2$, $y = 3(2) = 6$ When $x = 3$, $y = 3(3) = 9$ $\therefore R = \{(1, 3), (2, 6), (3, 9)\}$ Hence, the given relation R is a function.

(ii) $\{(x, y): y > x + 1, x = 1, 2 \text{ and } y = 2, 4, 6\}$

When $x = 1$, $y > 1 + 1$ or $y > 2 \Rightarrow y = \{4, 6\}$

When $x = 2$, $y > 2 + 1$ or $y > 3 \Rightarrow y = \{4, 6\}$

$\therefore R = \{(1, 4), (1, 6), (2, 4), (2, 6)\}$

Hence, the given relation R is not a function.

(iii) $\{(x, y): x + y = 3, x, y \in \{0, 1, 2, 3\}\}$

When $x = 0$, $0 + y = 3 \Rightarrow y = 3$

When $x = 1$, $1 + y = 3 \Rightarrow y = 2$

When $x = 2$, $2 + y = 3 \Rightarrow y = 1$

When $x = 3$, $3 + y = 3 \Rightarrow y = 0$

$\therefore R = \{(0, 3), (1, 2), (2, 1), (3, 0)\}$

Hence, the given relation R is a function.

9. Let $f: \mathbb{R} \rightarrow \mathbb{R}$ and $g: \mathbb{C} \rightarrow \mathbb{C}$ be two functions defined as $f(x) = x^2$ and $g(x) = x^2$. Are they equal functions?

Solution:

Given:

$f: \mathbb{R} \rightarrow \mathbb{R} \in f(x) = x^2$ and $g: \mathbb{R} \rightarrow \mathbb{R} \in g(x) = x^2$

f is defined from \mathbb{R} to \mathbb{R} , the domain of $f = \mathbb{R}$.

g is defined from \mathbb{C} to \mathbb{C} , the domain of $g = \mathbb{C}$.

Two functions are equal only when the domain and codomain of both the functions are equal.

In this case, the domain of $f \neq$ domain of g .

$\therefore f$ and g are not equal functions.

EXERCISE 3.2

PAGE NO: 3.11

1. If $f(x) = x^2 - 3x + 4$, then find the values of x satisfying the equation $f(x) = f(2x + 1)$.

Solution:

Given:

$$f(x) = x^2 - 3x + 4.$$

Let us find x satisfying $f(x) = f(2x + 1)$.

We have,

$$\begin{aligned} f(2x + 1) &= (2x + 1)^2 - 3(2x + 1) + 4 \\ &= (2x)^2 + 2(2x)(1) + 1^2 - 6x - 3 + 4 \\ &= 4x^2 + 4x + 1 - 6x + 1 \\ &= 4x^2 - 2x + 2 \end{aligned}$$

$$\text{Now, } f(x) = f(2x + 1)$$

$$x^2 - 3x + 4 = 4x^2 - 2x + 2$$

$$4x^2 - 2x + 2 - x^2 + 3x - 4 = 0$$

$$3x^2 + x - 2 = 0$$

$$3x^2 + 3x - 2x - 2 = 0$$

$$3x(x + 1) - 2(x + 1) = 0$$

$$(x + 1)(3x - 2) = 0$$

$$x + 1 = 0 \text{ or } 3x - 2 = 0$$

$$x = -1 \text{ or } 3x = 2$$

$$x = -1 \text{ or } 2/3$$

\therefore The values of x are -1 and $2/3$.

2. If $f(x) = (x - a)^2(x - b)^2$, find $f(a + b)$.

Solution:

Given:

$$f(x) = (x - a)^2(x - b)^2$$

Let us find $f(a + b)$.

We have,

$$f(a + b) = (a + b - a)^2(a + b - b)^2$$

$$f(a + b) = (b)^2(a)^2$$

$$\therefore f(a + b) = a^2b^2$$

3. If $y = f(x) = (ax - b) / (bx - a)$, show that $x = f(y)$.

Solution:

Given:

$$y = f(x) = (ax - b) / (bx - a) \Rightarrow f(y) = (ay - b) / (by - a)$$

Let us prove that $x = f(y)$.

We have,

$$y = (ax - b) / (bx - a)$$

By cross-multiplying,

$$y(bx - a) = ax - b$$

$$bxy - ay = ax - b$$

$$bxy - ax = ay - b$$

$$x(by - a) = ay - b$$

$$x = (ay - b) / (by - a) = f(y)$$

$$\therefore x = f(y)$$

Hence proved.

4. If $f(x) = 1 / (1 - x)$, show that $f[f\{f(x)\}] = x$.

Solution:

Given:

$$f(x) = 1 / (1 - x)$$

Let us prove that $f[f\{f(x)\}] = x$.

Firstly, let us solve for $f\{f(x)\}$.

$$\begin{aligned} f\{f(x)\} &= f\{1/(1-x)\} \\ &= 1 / 1 - (1/(1-x)) \\ &= 1 / [(1-x-1)/(1-x)] \\ &= 1 / (-x/(1-x)) \\ &= (1-x) / -x \\ &= (x-1) / x \end{aligned}$$

$$\therefore f\{f(x)\} = (x-1) / x$$

Now, we shall solve for $f[f\{f(x)\}]$

$$\begin{aligned} f[f\{f(x)\}] &= f[(x-1)/x] \\ &= 1 / [1 - (x-1)/x] \\ &= 1 / [(x - (x-1))/x] \\ &= 1 / [(x - x + 1)/x] \\ &= 1 / (1/x) \end{aligned}$$

$$\therefore f[f\{f(x)\}] = x$$

Hence proved.

5. If $f(x) = (x + 1) / (x - 1)$, show that $f[f(x)] = x$.

Solution:

Given:

$$f(x) = (x + 1) / (x - 1)$$

Let us prove that $f[f(x)] = x$.

$$\begin{aligned} f[f(x)] &= f[(x+1)/(x-1)] \\ &= [(x+1)/(x-1) + 1] / [(x+1)/(x-1) - 1] \\ &= [(x+1) + (x-1)] / (x-1) / [(x+1) - (x-1)] / (x-1) \\ &= [(x+1) + (x-1)] / [(x+1) - (x-1)] \\ &= (x+1+x-1) / (x+1-x+1) \\ &= 2x/2 \\ &= x \end{aligned}$$

$$\therefore f[f(x)] = x$$

Hence proved.

6. If

$$f(x) = \begin{cases} x^2, & \text{when } x < 0 \\ x, & \text{when } 0 \leq x < 1 \\ \frac{1}{x}, & \text{when } x \geq 1 \end{cases}$$

Find:

(i) $f(1/2)$

(ii) $f(-2)$

(iii) $f(1)$

(iv) $f(\sqrt{3})$

(v) $f(\sqrt{-3})$

Solution:

(i) $f(1/2)$

When, $0 \leq x \leq 1$, $f(x) = x$

$$\therefore f(1/2) = 1/2$$

(ii) $f(-2)$

When, $x < 0$, $f(x) = x^2$

$$f(-2) = (-2)^2$$

$$= 4$$

$$\therefore f(-2) = 4$$

(iii) $f(1)$

When, $x \geq 1$, $f(x) = 1/x$

$$f(1) = 1/1$$

$$\therefore f(1) = 1$$

RD Sharma Solutions for Class 11 Maths
Chapter 3 – Functions

(iv) $f(\sqrt{3})$

We have $\sqrt{3} = 1.732 > 1$

When, $x \geq 1$, $f(x) = 1/x$

$$\therefore f(\sqrt{3}) = 1/\sqrt{3}$$

(v) $f(\sqrt{-3})$

We know $\sqrt{-3}$ is not a real number and the function $f(x)$ is defined only when $x \in \mathbb{R}$.

$\therefore f(\sqrt{-3})$ does not exist.

EXERCISE 3.3

PAGE NO: 3.18

1. Find the domain of each of the following real valued functions of real variable:

(i) $f(x) = 1/x$

(ii) $f(x) = 1/(x-7)$

(iii) $f(x) = (3x-2)/(x+1)$

(iv) $f(x) = (2x+1)/(x^2-9)$

(v) $f(x) = (x^2+2x+1)/(x^2-8x+12)$

Solution:

(i) $f(x) = 1/x$

We know, $f(x)$ is defined for all real values of x , except for the case when $x = 0$.

$$\therefore \text{Domain of } f = \mathbb{R} - \{0\}$$

(ii) $f(x) = 1/(x-7)$

We know, $f(x)$ is defined for all real values of x , except for the case when $x - 7 = 0$ or $x = 7$.

$$\therefore \text{Domain of } f = \mathbb{R} - \{7\}$$

(iii) $f(x) = (3x-2)/(x+1)$

We know, $f(x)$ is defined for all real values of x , except for the case when $x + 1 = 0$ or $x = -1$.

$$\therefore \text{Domain of } f = \mathbb{R} - \{-1\}$$

(iv) $f(x) = (2x+1)/(x^2-9)$

We know, $f(x)$ is defined for all real values of x , except for the case when $x^2 - 9 = 0$.

$$x^2 - 9 = 0$$

$$x^2 - 3^2 = 0$$

$$(x+3)(x-3) = 0$$

$$x+3=0 \text{ or } x-3=0$$

$$x = \pm 3$$

$$\therefore \text{Domain of } f = \mathbb{R} - \{-3, 3\}$$

(v) $f(x) = (x^2+2x+1)/(x^2-8x+12)$

We know, $f(x)$ is defined for all real values of x , except for the case when $x^2 - 8x + 12 = 0$.

$$x^2 - 8x + 12 = 0$$

$$x^2 - 2x - 6x + 12 = 0$$

$$x(x-2) - 6(x-2) = 0$$

$$(x-2)(x-6) = 0$$

RD Sharma Solutions for Class 11 Maths
Chapter 3 – Functions

$$x - 2 = 0 \text{ or } x - 6 = 0$$

$$x = 2 \text{ or } 6$$

$$\therefore \text{Domain of } f = \mathbb{R} - \{2, 6\}$$

2. Find the domain of each of the following real valued functions of real variable:

(i) $f(x) = \sqrt{x-2}$

(ii) $f(x) = 1/(\sqrt{x^2-1})$

(iii) $f(x) = \sqrt{9-x^2}$

(iv) $f(x) = \sqrt{(x-2)/(3-x)}$

Solution:

(i) $f(x) = \sqrt{x-2}$

We know the square of a real number is never negative.

$f(x)$ takes real values only when $x - 2 \geq 0$

$$x \geq 2$$

$$\therefore x \in [2, \infty)$$

$$\therefore \text{Domain } (f) = [2, \infty)$$

(ii) $f(x) = 1/(\sqrt{x^2-1})$

We know the square of a real number is never negative.

$f(x)$ takes real values only when $x^2 - 1 \geq 0$

$$x^2 - 1^2 \geq 0$$

$$(x+1)(x-1) \geq 0$$

$$x \leq -1 \text{ or } x \geq 1$$

$$\therefore x \in (-\infty, -1] \cup [1, \infty)$$

In addition, $f(x)$ is also undefined when $x^2 - 1 = 0$ because denominator will be zero and the result will be indeterminate.

$$x^2 - 1 = 0 \Rightarrow x = \pm 1$$

$$\text{So, } x \in (-\infty, -1] \cup [1, \infty) - \{-1, 1\}$$

$$x \in (-\infty, -1) \cup (1, \infty)$$

$$\therefore \text{Domain } (f) = (-\infty, -1) \cup (1, \infty)$$

(iii) $f(x) = \sqrt{9-x^2}$

We know the square of a real number is never negative.

$f(x)$ takes real values only when $9 - x^2 \geq 0$

$$9 \geq x^2$$

$$x^2 \leq 9$$

$$x^2 - 9 \leq 0$$

$$x^2 - 3^2 \leq 0$$

$$(x+3)(x-3) \leq 0$$

$$x \geq -3 \text{ and } x \leq 3$$

$$x \in [-3, 3]$$

$$\therefore \text{Domain } (f) = [-3, 3]$$

$$\text{(iv) } f(x) = \sqrt{(x-2)/(3-x)}$$

We know the square root of a real number is never negative.

$f(x)$ takes real values only when $x - 2$ and $3 - x$ are both positive and negative.

(a) Both $x - 2$ and $3 - x$ are positive

$$x - 2 \geq 0$$

$$x \geq 2$$

$$3 - x \geq 0$$

$$x \leq 3$$

Hence, $x \geq 2$ and $x \leq 3$

$$\therefore x \in [2, 3]$$

(b) Both $x - 2$ and $3 - x$ are negative

$$x - 2 \leq 0$$

$$x \leq 2$$

$$3 - x \leq 0$$

$$x \geq 3$$

Hence, $x \leq 2$ and $x \geq 3$

However, the intersection of these sets is null set. Thus, this case is not possible.

Hence, $x \in [2, 3] - \{3\}$

$$x \in [2, 3]$$

$$\therefore \text{Domain } (f) = [2, 3]$$

3. Find the domain and range of each of the following real valued functions:

(i) $f(x) = (ax+b)/(bx-a)$

(ii) $f(x) = (ax-b)/(cx-d)$

(iii) $f(x) = \sqrt{x-1}$

(iv) $f(x) = \sqrt{x-3}$

(v) $f(x) = (x-2)/(2-x)$

(vi) $f(x) = |x-1|$

(vii) $f(x) = -|x|$

(viii) $f(x) = \sqrt{9-x^2}$

Solution:

(i) $f(x) = (ax+b)/(bx-a)$

$f(x)$ is defined for all real values of x , except for the case when $bx - a = 0$ or $x = a/b$.

$$\text{Domain } (f) = \mathbb{R} - (a/b)$$

$$\text{Let } f(x) = y$$

$$(ax+b)/(bx-a) = y$$

$$ax + b = y(bx - a)$$

$$ax + b = bxy - ay$$

$$ax - bxy = -ay - b$$

$$x(a - by) = -(ay + b)$$

$$\therefore x = -(ay+b)/(a-by)$$

$$\text{When } a - by = 0 \text{ or } y = a/b$$

Hence, $f(x)$ cannot take the value a/b .

$$\therefore \text{Range } (f) = \mathbb{R} - (a/b)$$

$$\text{(ii) } f(x) = (ax-b)/(cx-d)$$

$f(x)$ is defined for all real values of x , except for the case when $cx - d = 0$ or $x = d/c$.

$$\text{Domain } (f) = \mathbb{R} - (d/c)$$

$$\text{Let } f(x) = y$$

$$(ax-b)/(cx-d) = y$$

$$ax - b = y(cx - d)$$

$$ax - b = cxy - dy$$

$$ax - cxy = b - dy$$

$$x(a - cy) = b - dy$$

$$\therefore x = (b-dy)/(a-cy)$$

$$\text{When } a - cy = 0 \text{ or } y = a/c,$$

Hence, $f(x)$ cannot take the value a/c .

$$\therefore \text{Range } (f) = \mathbb{R} - (a/c)$$

$$\text{(iii) } f(x) = \sqrt{x-1}$$

We know the square of a real number is never negative.

$f(x)$ takes real values only when $x - 1 \geq 0$

$$x \geq 1$$

$$\therefore x \in [1, \infty)$$

$$\text{Thus, domain } (f) = [1, \infty)$$

$$\text{When } x \geq 1, \text{ we have } x - 1 \geq 0$$

$$\text{Hence, } \sqrt{x-1} \geq 0 \Rightarrow f(x) \geq 0$$

$$f(x) \in [0, \infty)$$

$$\therefore \text{Range } (f) = [0, \infty)$$

$$\text{(iv) } f(x) = \sqrt{x-3}$$

We know the square of a real number is never negative.

$f(x)$ takes real values only when $x - 3 \geq 0$

$$x \geq 3$$

$$\therefore x \in [3, \infty)$$

$$\text{Domain } (f) = [3, \infty)$$

When $x \geq 3$, we have $x - 3 \geq 0$

$$\text{Hence, } \sqrt{x-3} \geq 0 \Rightarrow f(x) \geq 0$$

$$f(x) \in [0, \infty)$$

$$\therefore \text{Range } (f) = [0, \infty)$$

$$(v) f(x) = (x-2)/(2-x)$$

$f(x)$ is defined for all real values of x , except for the case when $2 - x = 0$ or $x = 2$.

$$\text{Domain } (f) = \mathbb{R} - \{2\}$$

$$\text{We have, } f(x) = (x-2)/(2-x)$$

$$f(x) = -(2-x)/(2-x)$$

$$= -1$$

$$\text{When } x \neq 2, f(x) = -1$$

$$\therefore \text{Range } (f) = \{-1\}$$

$$(vi) f(x) = |x-1|$$

$$\text{we know } |x| = \begin{cases} -x, & x < 0 \\ x, & x \geq 0 \end{cases}$$

Now we have,

$$|x-1| = \begin{cases} -(x-1), & x-1 < 0 \\ x-1, & x-1 \geq 0 \end{cases}$$

$$\therefore f(x) = |x-1| = \begin{cases} 1-x, & x < 1 \\ x-1, & x \geq 1 \end{cases}$$

Hence, $f(x)$ is defined for all real numbers x .

$$\text{Domain } (f) = \mathbb{R}$$

When, $x < 1$, we have $x - 1 < 0$ or $1 - x > 0$.

$$|x-1| > 0 \Rightarrow f(x) > 0$$

When, $x \geq 1$, we have $x - 1 \geq 0$.

$$|x-1| \geq 0 \Rightarrow f(x) \geq 0$$

$$\therefore f(x) \geq 0 \text{ or } f(x) \in [0, \infty)$$

$$\text{Range } (f) = [0, \infty)$$

$$(vii) f(x) = -|x|$$

$$\text{we know } |x| = \begin{cases} -x, & x < 0 \\ x, & x \geq 0 \end{cases}$$

Now we have,

$$-|x| = \begin{cases} -(-x), & x < 0 \\ -x, & x \geq 0 \end{cases}$$

$$\therefore f(x) = -|x| = \begin{cases} x, & x < 0 \\ -x, & x \geq 0 \end{cases}$$

Hence, $f(x)$ is defined for all real numbers x .

Domain (f) = \mathbb{R}

When, $x < 0$, we have $-|x| < 0$

$$f(x) < 0$$

When, $x \geq 0$, we have $-x \leq 0$.

$$-|x| \leq 0 \Rightarrow f(x) \leq 0$$

$$\therefore f(x) \leq 0 \text{ or } f(x) \in (-\infty, 0]$$

$$\text{Range } (f) = (-\infty, 0]$$

$$\text{(viii) } f(x) = \sqrt{9-x^2}$$

We know the square of a real number is never negative.

$f(x)$ takes real values only when $9 - x^2 \geq 0$

$$9 \geq x^2$$

$$x^2 \leq 9$$

$$x^2 - 9 \leq 0$$

$$x^2 - 3^2 \leq 0$$

$$(x+3)(x-3) \leq 0$$

$$x \geq -3 \text{ and } x \leq 3$$

$$\therefore x \in [-3, 3]$$

$$\text{Domain } (f) = [-3, 3]$$

When, $x \in [-3, 3]$, we have $0 \leq 9 - x^2 \leq 9$

$$0 \leq \sqrt{9-x^2} \leq 3 \Rightarrow 0 \leq f(x) \leq 3$$

$$\therefore f(x) \in [0, 3]$$

$$\text{Range } (f) = [0, 3]$$

EXERCISE 3.4

PAGE NO: 3.38

1. Find $f + g$, $f - g$, cf ($c \in \mathbb{R}$, $c \neq 0$), fg , $1/f$ and f/g in each of the following:

(i) $f(x) = x^3 + 1$ and $g(x) = x + 1$

(ii) $f(x) = \sqrt[3]{(x-1)}$ and $g(x) = \sqrt[3]{(x+1)}$

Solution:

(i) $f(x) = x^3 + 1$ and $g(x) = x + 1$

We have $f(x): \mathbb{R} \rightarrow \mathbb{R}$ and $g(x): \mathbb{R} \rightarrow \mathbb{R}$

(a) $f + g$

We know, $(f + g)(x) = f(x) + g(x)$

$$\begin{aligned}(f + g)(x) &= x^3 + 1 + x + 1 \\ &= x^3 + x + 2\end{aligned}$$

So, $(f + g)(x): \mathbb{R} \rightarrow \mathbb{R}$ $\therefore f + g: \mathbb{R} \rightarrow \mathbb{R}$ is given by $(f + g)(x) = x^3 + x + 2$

(b) $f - g$

We know, $(f - g)(x) = f(x) - g(x)$

$$\begin{aligned}(f - g)(x) &= x^3 + 1 - (x + 1) \\ &= x^3 + 1 - x - 1 \\ &= x^3 - x\end{aligned}$$

So, $(f - g)(x): \mathbb{R} \rightarrow \mathbb{R}$ $\therefore f - g: \mathbb{R} \rightarrow \mathbb{R}$ is given by $(f - g)(x) = x^3 - x$

(c) cf ($c \in \mathbb{R}$, $c \neq 0$)

We know, $(cf)(x) = c \times f(x)$

$$\begin{aligned}(cf)(x) &= c(x^3 + 1) \\ &= cx^3 + c\end{aligned}$$

So, $(cf)(x): \mathbb{R} \rightarrow \mathbb{R}$ $\therefore cf: \mathbb{R} \rightarrow \mathbb{R}$ is given by $(cf)(x) = cx^3 + c$

(d) fg

We know, $(fg)(x) = f(x)g(x)$

$$\begin{aligned}(fg)(x) &= (x^3 + 1)(x + 1) \\ &= (x + 1)(x^2 - x + 1)(x + 1) \\ &= (x + 1)^2(x^2 - x + 1)\end{aligned}$$

So, $(fg)(x): \mathbb{R} \rightarrow \mathbb{R}$ $\therefore fg: \mathbb{R} \rightarrow \mathbb{R}$ is given by $(fg)(x) = (x + 1)^2(x^2 - x + 1)$

RD Sharma Solutions for Class 11 Maths
Chapter 3 – Functions(e) $1/f$ We know, $(1/f)(x) = 1/f(x)$

$$1/f(x) = 1/(x^3 + 1)$$

Observe that $1/f(x)$ is undefined when $f(x) = 0$ or when $x = -1$.So, $1/f: \mathbb{R} - \{-1\} \rightarrow \mathbb{R}$ is given by $1/f(x) = 1/(x^3 + 1)$ (f) f/g We know, $(f/g)(x) = f(x)/g(x)$

$$(f/g)(x) = (x^3 + 1)/(x + 1)$$

Observe that $(x^3 + 1)/(x + 1)$ is undefined when $g(x) = 0$ or when $x = -1$.Using $x^3 + 1 = (x + 1)(x^2 - x + 1)$, we have

$$(f/g)(x) = [(x+1)(x^2 - x + 1)/(x+1)] \\ = x^2 - x + 1$$

 $\therefore f/g: \mathbb{R} - \{-1\} \rightarrow \mathbb{R}$ is given by $(f/g)(x) = x^2 - x + 1$ (ii) $f(x) = \sqrt{x-1}$ and $g(x) = \sqrt{x+1}$ We have $f(x): [1, \infty) \rightarrow \mathbb{R}^+$ and $g(x): [-1, \infty) \rightarrow \mathbb{R}^+$ as real square root is defined only for non-negative numbers.(a) $f + g$ We know, $(f + g)(x) = f(x) + g(x)$

$$(f+g)(x) = \sqrt{x-1} + \sqrt{x+1}$$

Domain of $(f + g) = \text{Domain of } f \cap \text{Domain of } g$

$$\text{Domain of } (f + g) = [1, \infty) \cap [-1, \infty)$$

$$\text{Domain of } (f + g) = [1, \infty)$$

 $\therefore f + g: [1, \infty) \rightarrow \mathbb{R}$ is given by $(f+g)(x) = \sqrt{x-1} + \sqrt{x+1}$ (b) $f - g$ We know, $(f - g)(x) = f(x) - g(x)$

$$(f-g)(x) = \sqrt{x-1} - \sqrt{x+1}$$

Domain of $(f - g) = \text{Domain of } f \cap \text{Domain of } g$

$$\text{Domain of } (f - g) = [1, \infty) \cap [-1, \infty)$$

$$\text{Domain of } (f - g) = [1, \infty)$$

 $\therefore f - g: [1, \infty) \rightarrow \mathbb{R}$ is given by $(f-g)(x) = \sqrt{x-1} - \sqrt{x+1}$ (c) cf ($c \in \mathbb{R}, c \neq 0$)We know, $(cf)(x) = c \times f(x)$

$$(cf)(x) = c\sqrt{x-1}$$

Domain of $(cf) = \text{Domain of } f$

Domain of $(cf) = [1, \infty)$

$\therefore cf: [1, \infty) \rightarrow \mathbb{R}$ is given by $(cf)(x) = c\sqrt{x-1}$

(d) fg

We know, $(fg)(x) = f(x)g(x)$

$$\begin{aligned}(fg)(x) &= \sqrt{x-1} \sqrt{x+1} \\ &= \sqrt{x^2 - 1}\end{aligned}$$

Domain of $(fg) = \text{Domain of } f \cap \text{Domain of } g$

$$\text{Domain of } (fg) = [1, \infty) \cap [-1, \infty)$$

$$\text{Domain of } (fg) = [1, \infty)$$

$\therefore fg: [1, \infty) \rightarrow \mathbb{R}$ is given by $(fg)(x) = \sqrt{x^2 - 1}$

(e) $1/f$

We know, $(1/f)(x) = 1/f(x)$

$$(1/f)(x) = 1/\sqrt{x-1}$$

Domain of $(1/f) = \text{Domain of } f$

$$\text{Domain of } (1/f) = [1, \infty)$$

Observe that $1/\sqrt{x-1}$ is also undefined when $x - 1 = 0$ or $x = 1$.

$\therefore 1/f: (1, \infty) \rightarrow \mathbb{R}$ is given by $(1/f)(x) = 1/\sqrt{x-1}$

(f) f/g

We know, $(f/g)(x) = f(x)/g(x)$

$$(f/g)(x) = \sqrt{x-1}/\sqrt{x+1}$$

$$(f/g)(x) = \sqrt{[(x-1)/(x+1)]}$$

Domain of $(f/g) = \text{Domain of } f \cap \text{Domain of } g$

$$\text{Domain of } (f/g) = [1, \infty) \cap [-1, \infty)$$

$$\text{Domain of } (f/g) = [1, \infty)$$

$\therefore f/g: [1, \infty) \rightarrow \mathbb{R}$ is given by $(f/g)(x) = \sqrt{[(x-1)/(x+1)]}$

2. Let $f(x) = 2x + 5$ and $g(x) = x^2 + x$. Describe

(i) $f + g$

(ii) $f - g$

(iii) fg

(iv) f/g

Find the domain in each case.

Solution:

Given:

$$f(x) = 2x + 5 \text{ and } g(x) = x^2 + x$$

Both $f(x)$ and $g(x)$ are defined for all $x \in \mathbb{R}$.

So, domain of $f = \text{domain of } g = \mathbb{R}$

(i) $f + g$

We know, $(f + g)(x) = f(x) + g(x)$

$$\begin{aligned}(f + g)(x) &= 2x + 5 + x^2 + x \\ &= x^2 + 3x + 5\end{aligned}$$

$(f + g)(x)$ is defined for all real numbers x .

\therefore The domain of $(f + g)$ is \mathbb{R}

(ii) $f - g$

We know, $(f - g)(x) = f(x) - g(x)$

$$\begin{aligned}(f - g)(x) &= 2x + 5 - (x^2 + x) \\ &= 2x + 5 - x^2 - x \\ &= 5 + x - x^2\end{aligned}$$

$(f - g)(x)$ is defined for all real numbers x .

\therefore The domain of $(f - g)$ is \mathbb{R}

(iii) fg

We know, $(fg)(x) = f(x)g(x)$

$$\begin{aligned}(fg)(x) &= (2x + 5)(x^2 + x) \\ &= 2x(x^2 + x) + 5(x^2 + x) \\ &= 2x^3 + 2x^2 + 5x^2 + 5x \\ &= 2x^3 + 7x^2 + 5x\end{aligned}$$

$(fg)(x)$ is defined for all real numbers x .

\therefore The domain of fg is \mathbb{R}

(iv) f/g

We know, $(f/g)(x) = f(x)/g(x)$

$$(f/g)(x) = (2x+5)/(x^2+x)$$

$(f/g)(x)$ is defined for all real values of x , except for the case when $x^2 + x = 0$.

$$x^2 + x = 0$$

$$x(x + 1) = 0$$

$$x = 0 \text{ or } x + 1 = 0$$

$$x = 0 \text{ or } -1$$

When $x = 0$ or -1 , $(f/g)(x)$ will be undefined as the division result will be indeterminate.

\therefore The domain of $f/g = \mathbb{R} - \{-1, 0\}$

3. If $f(x)$ be defined on $[-2, 2]$ and is given by $f(x) = \begin{cases} -1, & -2 \leq x \leq 0 \\ x - 1, & 0 < x \leq 2 \end{cases}$ and $g(x) = f(|x|) + |f(x)|$. Find $g(x)$.

Solution:

Given:

$$f(x) = \begin{cases} -1, & -2 \leq x \leq 0 \\ x-1, & 0 < x \leq 2 \end{cases} \text{ and}$$

$$g(x) = f(|x|) + |f(x)|$$

Now we have,

$$f(|x|) = \begin{cases} -1, & -2 \leq |x| \leq 0 \\ |x|-1, & 0 < |x| \leq 2 \end{cases}$$

However, $|x| \geq 0 \Rightarrow f(|x|) = |x| - 1$ when $0 < |x| \leq 2$

We also have,

$$\begin{aligned} |f(x)| &= \begin{cases} |-1|, & -2 \leq x \leq 0 \\ |x-1|, & 0 < x \leq 2 \end{cases} \\ &= \begin{cases} 1, & -2 \leq x \leq 0 \\ |x-1|, & 0 < x \leq 2 \end{cases} \end{aligned}$$

We also know,

$$\begin{aligned} |x-1| &= \begin{cases} -(x-1), & x-1 < 0 \\ x-1, & x-1 \geq 0 \end{cases} \\ &= \begin{cases} -(x-1), & x < 1 \\ x-1, & x \geq 1 \end{cases} \end{aligned}$$

Here, we shall only the range between $[0, 2]$.

$$|x-1| = \begin{cases} -(x-1), & 0 < x < 1 \\ x-1, & 1 \leq x \leq 2 \end{cases}$$

Substituting this value of $|x-1|$ in $|f(x)|$, we get

$$\begin{aligned} |f(x)| &= \begin{cases} 1, & -2 \leq x \leq 0 \\ -(x-1), & 0 < x < 1 \\ x-1, & 1 \leq x \leq 2 \end{cases} \\ &= \begin{cases} 1, & -2 \leq x \leq 0 \\ 1-x, & 0 < x < 1 \\ x-1, & 1 \leq x \leq 2 \end{cases} \end{aligned}$$

Now, we need to find $g(x)$

$$g(x) = f(|x|) + |f(x)|$$

$$= |x| - 1 \text{ when } 0 < |x| \leq 2 + \begin{cases} 1, & -2 \leq x \leq 0 \\ 1-x, & 0 < x < 1 \\ x-1, & 1 \leq x \leq 2 \end{cases}$$

$$\begin{aligned}
 g(x) &= \begin{cases} -x-1, -2 \leq x \leq 0 \\ x-1, 0 < x < 1 \\ x-1, 1 \leq x \leq 2 \end{cases} + \begin{cases} 1, -2 \leq x \leq 0 \\ 1-x, 0 < x < 1 \\ x-1, 1 \leq x \leq 2 \end{cases} \\
 &= \begin{cases} -x-1+1, -2 \leq x \leq 0 \\ x-1+1-x, 0 < x < 1 \\ x-1+x-1, 1 \leq x \leq 2 \end{cases} \\
 &= \begin{cases} -x, -2 \leq x \leq 0 \\ 0, 0 < x < 1 \\ 2(x-1), 1 \leq x \leq 2 \end{cases}
 \end{aligned}$$

$$\begin{aligned}
 \therefore g(x) &= f(|x|) + |f(x)| \\
 &= \begin{cases} -x, -2 \leq x \leq 0 \\ 0, 0 < x < 1 \\ 2(x-1), 1 \leq x \leq 2 \end{cases}
 \end{aligned}$$

4. Let f, g be two real functions defined by $f(x) = \sqrt{x+1}$ and $g(x) = \sqrt{9-x^2}$. Then, describe each of the following functions.

(i) $f + g$

(ii) $g - f$

(iii) fg

(iv) f/g

(v) g/f

(vi) $2f - \sqrt{5}g$

(vii) $f^2 + 7f$

(viii) $5/g$

Solution:

Given:

$$f(x) = \sqrt{x+1} \text{ and } g(x) = \sqrt{9-x^2}$$

We know the square of a real number is never negative.

So, $f(x)$ takes real values only when $x+1 \geq 0$

$$x \geq -1, x \in [-1, \infty)$$

$$\text{Domain of } f = [-1, \infty)$$

Similarly, $g(x)$ takes real values only when $9 - x^2 \geq 0$

$$9 \geq x^2$$

$$x^2 \leq 9$$

$$x^2 - 9 \leq 0$$

$$x^2 - 3^2 \leq 0$$

$$(x+3)(x-3) \leq 0$$

$$x \geq -3 \text{ and } x \leq 3$$

$$\therefore x \in [-3, 3]$$

$$\text{Domain of } g = [-3, 3]$$

(i) $f + g$

$$\text{We know, } (f + g)(x) = f(x) + g(x)$$

$$(f + g)(x) = \sqrt{x+1} + \sqrt{9-x^2}$$

$$\text{Domain of } f + g = \text{Domain of } f \cap \text{Domain of } g$$

$$= [-1, \infty) \cap [-3, 3]$$

$$= [-1, 3]$$

$$\therefore f + g: [-1, 3] \rightarrow \mathbb{R} \text{ is given by } (f + g)(x) = f(x) + g(x) = \sqrt{x+1} + \sqrt{9-x^2}$$

(ii) $g - f$

$$\text{We know, } (g - f)(x) = g(x) - f(x)$$

$$(g - f)(x) = \sqrt{9-x^2} - \sqrt{x+1}$$

$$\text{Domain of } g - f = \text{Domain of } g \cap \text{Domain of } f$$

$$= [-3, 3] \cap [-1, \infty)$$

$$= [-1, 3]$$

$$\therefore g - f: [-1, 3] \rightarrow \mathbb{R} \text{ is given by } (g - f)(x) = g(x) - f(x) = \sqrt{9-x^2} - \sqrt{x+1}$$

(iii) fg

$$\text{We know, } (fg)(x) = f(x)g(x)$$

$$(fg)(x) = \sqrt{x+1} \sqrt{9-x^2}$$

$$= \sqrt{[(x+1)(9-x^2)]}$$

$$= \sqrt{[x(9-x^2) + (9-x^2)]}$$

$$= \sqrt{9x-x^3+9-x^2}$$

$$= \sqrt{9+9x-x^2-x^3}$$

$$\text{Domain of } fg = \text{Domain of } f \cap \text{Domain of } g$$

$$= [-1, \infty) \cap [-3, 3]$$

$$= [-1, 3]$$

$$\therefore fg: [-1, 3] \rightarrow \mathbb{R} \text{ is given by } (fg)(x) = f(x)g(x) = \sqrt{x+1} \sqrt{9-x^2} = \sqrt{9+9x-x^2-x^3}$$

(iv) f/g

$$\text{We know, } (f/g)(x) = f(x)/g(x)$$

$$(f/g)(x) = \sqrt{x+1} / \sqrt{9-x^2}$$

$$= \sqrt{[(x+1) / (9-x^2)]}$$

$$\text{Domain of } f/g = \text{Domain of } f \cap \text{Domain of } g$$

$$= [-1, \infty) \cap [-3, 3]$$

$$= [-1, 3]$$

However, $(f/g)(x)$ is defined for all real values of $x \in [-1, 3]$, except for the case when $9 - x^2 = 0$ or $x = \pm 3$

When $x = \pm 3$, $(f/g)(x)$ will be undefined as the division result will be indeterminate.

Domain of $f/g = [-1, 3] - \{-3, 3\}$

Domain of $f/g = [-1, 3]$

$\therefore f/g: [-1, 3] \rightarrow \mathbb{R}$ is given by $(f/g)(x) = f(x)/g(x) = \sqrt[3]{(x+1)} / \sqrt[3]{(9-x^2)}$

(v) g/f

We know, $(g/f)(x) = g(x)/f(x)$

$(g/f)(x) = \sqrt[3]{(9-x^2)} / \sqrt[3]{(x+1)}$

$= \sqrt[3]{[(9-x^2) / (x+1)]}$

Domain of $g/f = \text{Domain of } f \cap \text{Domain of } g$

$= [-1, \infty) \cap [-3, 3]$

$= [-1, 3]$

However, $(g/f)(x)$ is defined for all real values of $x \in [-1, 3]$, except for the case when $x + 1 = 0$ or $x = -1$

When $x = -1$, $(g/f)(x)$ will be undefined as the division result will be indeterminate.

Domain of $g/f = [-1, 3] - \{-1\}$

Domain of $g/f = (-1, 3]$

$\therefore g/f: (-1, 3] \rightarrow \mathbb{R}$ is given by $(g/f)(x) = g(x)/f(x) = \sqrt[3]{(9-x^2)} / \sqrt[3]{(x+1)}$

(vi) $2f - \sqrt[3]{5}g$

We know, $(2f - \sqrt[3]{5}g)(x) = 2f(x) - \sqrt[3]{5}g(x)$

$(2f - \sqrt[3]{5}g)(x) = 2f(x) - \sqrt[3]{5}g(x)$

$= 2\sqrt[3]{(x+1)} - \sqrt[3]{5}\sqrt[3]{(9-x^2)}$

$= 2\sqrt[3]{(x+1)} - \sqrt[3]{(45 - 5x^2)}$

Domain of $2f - \sqrt[3]{5}g = \text{Domain of } f \cap \text{Domain of } g$

$= [-1, \infty) \cap [-3, 3]$

$= [-1, 3]$

$\therefore 2f - \sqrt[3]{5}g: [-1, 3] \rightarrow \mathbb{R}$ is given by $(2f - \sqrt[3]{5}g)(x) = 2f(x) - \sqrt[3]{5}g(x) = 2\sqrt[3]{(x+1)} - \sqrt[3]{(45 - 5x^2)}$

(vii) $f^2 + 7f$

We know, $(f^2 + 7f)(x) = f^2(x) + (7f)(x)$

$(f^2 + 7f)(x) = f(x)f(x) + 7f(x)$

$= \sqrt[3]{(x+1)} \sqrt[3]{(x+1)} + 7\sqrt[3]{(x+1)}$

$= x + 1 + 7\sqrt[3]{(x+1)}$

Domain of $f^2 + 7f$ is same as domain of f .

Domain of $f^2 + 7f = [-1, \infty)$

$\therefore f^2 + 7f: [-1, \infty) \rightarrow \mathbb{R}$ is given by $(f^2 + 7f)(x) = f(x)f(x) + 7f(x) = x + 1 + 7\sqrt[3]{(x+1)}$

(viii) $5/g$ We know, $(5/g)(x) = 5/g(x)$

$$(5/g)(x) = 5/\sqrt{9-x^2}$$

Domain of $5/g$ = Domain of $g = [-3, 3]$ However, $(5/g)(x)$ is defined for all real values of $x \in [-3, 3]$, except for the case when $9 - x^2 = 0$ or $x = \pm 3$ When $x = \pm 3$, $(5/g)(x)$ will be undefined as the division result will be indeterminate.

$$\begin{aligned}\text{Domain of } 5/g &= [-3, 3] - \{-3, 3\} \\ &= (-3, 3)\end{aligned}$$

$$\therefore 5/g: (-3, 3) \rightarrow \mathbb{R} \text{ is given by } (5/g)(x) = 5/g(x) = 5/\sqrt{9-x^2}$$

5. If $f(x) = \log_e(1-x)$ and $g(x) = [x]$, then determine each of the following functions:**(i) $f + g$** **(ii) fg** **(iii) f/g** **(iv) g/f** **Also, find $(f + g)(-1)$, $(fg)(0)$, $(f/g)(1/2)$ and $(g/f)(1/2)$.****Solution:**

Given:

$$f(x) = \log_e(1-x) \text{ and } g(x) = [x]$$

We know, $f(x)$ takes real values only when $1 - x > 0$

$$1 > x$$

$$x < 1, \therefore x \in (-\infty, 1)$$

$$\text{Domain of } f = (-\infty, 1)$$

Similarly, $g(x)$ is defined for all real numbers x .

$$\begin{aligned}\text{Domain of } g &= [x], x \in \mathbb{R} \\ &= \mathbb{R}\end{aligned}$$

(i) $f + g$

$$\text{We know, } (f + g)(x) = f(x) + g(x)$$

$$(f + g)(x) = \log_e(1-x) + [x]$$

$$\text{Domain of } f + g = \text{Domain of } f \cap \text{Domain of } g$$

$$\begin{aligned}\text{Domain of } f + g &= (-\infty, 1) \cap \mathbb{R} \\ &= (-\infty, 1)\end{aligned}$$

$$\therefore f + g: (-\infty, 1) \rightarrow \mathbb{R} \text{ is given by } (f + g)(x) = \log_e(1-x) + [x]$$

(ii) fg

We know, $(fg)(x) = f(x)g(x)$

$$(fg)(x) = \log_e(1-x) \times [x]$$

$$= [x] \log_e(1-x)$$

Domain of fg = Domain of $f \cap$ Domain of g

$$= (-\infty, 1) \cap \mathbb{R}$$

$$= (-\infty, 1)$$

$\therefore fg: (-\infty, 1) \rightarrow \mathbb{R}$ is given by $(fg)(x) = [x] \log_e(1-x)$

(iii) f/g

We know, $(f/g)(x) = f(x)/g(x)$

$$(f/g)(x) = \log_e(1-x) / [x]$$

Domain of f/g = Domain of $f \cap$ Domain of g

$$= (-\infty, 1) \cap \mathbb{R}$$

$$= (-\infty, 1)$$

However, $(f/g)(x)$ is defined for all real values of $x \in (-\infty, 1)$, except for the case when $[x] = 0$.

We have, $[x] = 0$ when $0 \leq x < 1$ or $x \in [0, 1)$

When $0 \leq x < 1$, $(f/g)(x)$ will be undefined as the division result will be indeterminate.

Domain of $f/g = (-\infty, 1) - [0, 1)$

$$= (-\infty, 0)$$

$\therefore f/g: (-\infty, 0) \rightarrow \mathbb{R}$ is given by $(f/g)(x) = \log_e(1-x) / [x]$

(iv) g/f

We know, $(g/f)(x) = g(x)/f(x)$

$$(g/f)(x) = [x] / \log_e(1-x)$$

However, $(g/f)(x)$ is defined for all real values of $x \in (-\infty, 1)$, except for the case when $\log_e(1-x) = 0$.

$$\log_e(1-x) = 0 \Rightarrow 1-x = 1 \text{ or } x = 0$$

When $x = 0$, $(g/f)(x)$ will be undefined as the division result will be indeterminate.

Domain of $g/f = (-\infty, 1) - \{0\}$

$$= (-\infty, 0) \cup (0, 1)$$

$\therefore g/f: (-\infty, 0) \cup (0, 1) \rightarrow \mathbb{R}$ is given by $(g/f)(x) = [x] / \log_e(1-x)$

(a) We need to find $(f+g)(-1)$.

We have, $(f+g)(x) = \log_e(1-x) + [x]$, $x \in (-\infty, 1)$

Substituting $x = -1$ in the above equation, we get

$$(f+g)(-1) = \log_e(1-(-1)) + [-1]$$

$$= \log_e(1+1) + (-1)$$

$$= \log_e 2 - 1$$

$$\therefore (f + g)(-1) = \log_e 2 - 1$$

(b) We need to find $(fg)(0)$.

We have, $(fg)(x) = [x] \log_e(1 - x)$, $x \in (-\infty, 1)$

Substituting $x = 0$ in the above equation, we get

$$\begin{aligned}(fg)(0) &= [0] \log_e(1 - 0) \\ &= 0 \times \log_e 1\end{aligned}$$

$$\therefore (fg)(0) = 0$$

(c) We need to find $(f/g)(1/2)$

We have, $(f/g)(x) = \log_e(1 - x) / [x]$, $x \in (-\infty, 0)$

However, $1/2$ is not in the domain of f/g .

$\therefore (f/g)(1/2)$ does not exist.

(d) We need to find $(g/f)(1/2)$

We have, $(g/f)(x) = [x] / \log_e(1 - x)$, $x \in (-\infty, 0) \cup (0, \infty)$

Substituting $x=1/2$ in the above equation, we get

$$\begin{aligned}(g/f)(1/2) &= [x] / \log_e(1 - x) \\ &= (1/2) / \log_e(1 - 1/2) \\ &= 0.5 / \log_e(1/2) \\ &= 0 / \log_e(1/2) \\ &= 0\end{aligned}$$

$$\therefore (g/f)(1/2) = 0$$
