

RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of SolidsEXERCISE 15(A)

PAGE: 555

**1. Find the volume, the lateral surface area and the total surface area of the cuboid whose dimensions are:****(i) length = 12cm, breadth = 8cm and height = 4.5cm****(ii) length = 26m, breadth = 14m and height = 6.5m****(iii) length = 15m, breadth = 6m and height = 5dm****(iv) length = 24m, breadth = 25cm and height = 6m.****Solution:****(i)** It is given that length = 12cm, breadth = 8cm and height = 4.5cm

We know that

$$\text{Volume of cuboid} = l \times b \times h$$

By substituting the values we get

$$\text{Volume of cuboid} = 12 \times 8 \times 4.5$$

By multiplication

$$\text{Volume of cuboid} = 432 \text{ cm}^3$$

We know that

$$\text{Lateral surface area of a cuboid} = 2(l + b) \times h$$

By substituting the values

$$\text{Lateral surface area of a cuboid} = 2(12 + 8) \times 4.5$$

On further calculation

$$\text{Lateral surface area of a cuboid} = 2 \times 20 \times 4.5$$

By multiplication

$$\text{Lateral surface area of a cuboid} = 180 \text{ cm}^2$$

We know that

$$\text{Total surface area of cuboid} = 2(lb + bh + lh)$$

By substituting the values

$$\text{Total surface area of cuboid} = 2(12 \times 8 + 8 \times 4.5 + 12 \times 4.5)$$

On further calculation

$$\text{Total surface area of cuboid} = 2(96 + 36 + 54)$$

So we get

$$\text{Total surface area of cuboid} = 2 \times 186$$

By multiplication

$$\text{Total surface area of cuboid} = 372 \text{ cm}^2$$

**(ii)** It is given that length = 26m, breadth = 14m and height = 6.5m

We know that

$$\text{Volume of cuboid} = l \times b \times h$$

By substituting the values we get

$$\text{Volume of cuboid} = 26 \times 14 \times 6.5$$

By multiplication

$$\text{Volume of cuboid} = 2366 \text{ m}^3$$

We know that

$$\text{Lateral surface area of a cuboid} = 2(l + b) \times h$$

By substituting the values

$$\text{Lateral surface area of a cuboid} = 2(26 + 14) \times 6.5$$

On further calculation

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Lateral surface area of a cuboid =  $2 \times 40 \times 6.5$

By multiplication

Lateral surface area of a cuboid =  $520\text{cm}^2$

We know that

Total surface area of cuboid =  $2(lb + bh + lh)$

By substituting the values

Total surface area of cuboid =  $2(26 \times 14 + 14 \times 6.5 + 26 \times 6.5)$

On further calculation

Total surface area of cuboid =  $2(364 + 91 + 169)$

So we get

Total surface area of cuboid =  $2 \times 624$

By multiplication

Total surface area of cuboid =  $1248\text{ m}^2$

(iii) It is given that length = 15m, breadth = 6m and height = 5dm = 0.5m

We know that

Volume of cuboid =  $l \times b \times h$

By substituting the values we get

Volume of cuboid =  $15 \times 6 \times 0.5$

By multiplication

Volume of cuboid =  $45\text{ m}^3$

We know that

Lateral surface area of a cuboid =  $2(l + b) \times h$

By substituting the values

Lateral surface area of a cuboid =  $2(15 + 6) \times 0.5$

On further calculation

Lateral surface area of a cuboid =  $2 \times 21 \times 0.5$

By multiplication

Lateral surface area of a cuboid =  $21\text{ m}^2$

We know that

Total surface area of cuboid =  $2(lb + bh + lh)$

By substituting the values

Total surface area of cuboid =  $2(15 \times 6 + 6 \times 0.5 + 15 \times 0.5)$

On further calculation

Total surface area of cuboid =  $2(90 + 3 + 7.5)$

So we get

Total surface area of cuboid =  $2 \times 100.5$

By multiplication

Total surface area of cuboid =  $201\text{ m}^2$

(iv) It is given that length = 24m, breadth = 25cm = 0.25m and height = 6m

We know that

Volume of cuboid =  $l \times b \times h$

By substituting the values we get

Volume of cuboid =  $24 \times 0.25 \times 6$

By multiplication

Volume of cuboid =  $36\text{ m}^3$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

We know that

Lateral surface area of a cuboid =  $2(l + b) \times h$

By substituting the values

Lateral surface area of a cuboid =  $2(24 + 0.25) \times 6$

On further calculation

Lateral surface area of a cuboid =  $2 \times 24.25 \times 6$

By multiplication

Lateral surface area of a cuboid =  $291 \text{ m}^2$

We know that

Total surface area of cuboid =  $2(lb + bh + lh)$

By substituting the values

Total surface area of cuboid =  $2(24 \times 0.25 + 0.25 \times 6 + 24 \times 6)$

On further calculation

Total surface area of cuboid =  $2(6 + 1.5 + 144)$

So we get

Total surface area of cuboid =  $2 \times 151.5$

By multiplication

Total surface area of cuboid =  $303 \text{ m}^2$

**2. A matchbox measure  $4\text{cm} \times 2.5\text{cm} \times 1.5 \text{ cm}$ . What is the volume of a packet containing 12 such matchboxes?**

**Solution:**

It is given that

Length of the matchbox =  $4\text{cm}$

Breadth of the matchbox =  $2.5\text{cm}$

Height of the matchbox =  $1.5\text{cm}$

We know that

Volume of one matchbox = volume of cuboid =  $l \times b \times h$

By substituting the values

Volume of one matchbox =  $4 \times 2.5 \times 1.5$

By multiplication

Volume of one matchbox =  $15 \text{ cm}^3$

So the volume of 12 such matchboxes =  $12 \times 15 = 180 \text{ cm}^3$

Therefore, the volume of a packet containing 12 such matchboxes is  $180 \text{ cm}^3$ .

**3. A cuboidal water tank is  $6\text{m}$  long,  $5\text{m}$  wide and  $4.5\text{m}$  deep. How many litres of water can it hold? (Given,  $1\text{m}^3 = 1000 \text{ litres}$ .)**

**Solution:**

It is given that

Length of the cuboidal water tank =  $6\text{m}$

Breadth of the cuboidal water tank =  $5\text{m}$

Height of the cuboidal water tank =  $4.5\text{m}$

We know that

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Volume of a cuboidal water tank =  $l \times b \times h$

By substituting the values

Volume of a cuboidal water tank =  $6 \times 5 \times 4.5$

By multiplication

Volume of a cuboidal water tank =  $135 \text{ m}^3$

We know that  $1 \text{ m}^3 = 1000 \text{ litres}$

So we get

Volume of a cuboidal water tank =  $135 \times 1000 = 135000 \text{ litres}$

Therefore, the cuboidal water tank can hold 135000 litres of water.

**4. The capacity of a cuboidal tank is 50000 litres of water. Find the breadth of the tank if its length and depth are respectively 10m and 2.5m. (Given, 1000 litres =  $1 \text{ m}^3$ .)**

**Solution:**

It is given that

Length of the cuboidal tank = 10m

Depth of the cuboidal tank = 2.5m

Volume of the cuboidal tank = 5000 litres =  $50 \text{ m}^3$

We know that

Volume of a cuboidal tank =  $l \times b \times h$

By substituting the values

$50 = 10 \times b \times 2.5$

On further calculation

$b = 2\text{m}$

Therefore, the breadth of the cuboidal tank is 2m.

**5. A godown measure  $40\text{m} \times 25\text{m} \times 15\text{m}$ . Find the maximum number of wooden crates, each measuring  $1.5\text{m} \times 1.25\text{m} \times 0.5\text{m}$  that can be stored in the godown.**

**Solution:**

It is given that

Length of the godown = 40m

Breadth of the godown = 25m

Height of the godown = 15m

We know that

Volume of godown =  $l \times b \times h$

By substituting the values

Volume of godown =  $40 \times 25 \times 15$

On further calculation

Volume of godown =  $15000 \text{ m}^3$

It is given that

Length of wooden crate = 1.5m

Breadth of wooden crate = 1.25m

Height of wooden crate = 0.5m

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

We know that

$$\text{Volume of each wooden crate} = l \times b \times h$$

By substituting the values

$$\text{Volume of each wooden crate} = 1.5 \times 1.25 \times 0.5$$

On further calculation

$$\text{Volume of each wooden crate} = 0.9375 \text{ m}^3$$

So we get

$$\text{Number of wooden crates that can be stored in godown} = \text{Volume of godown} / \text{Volume of each wooden crate}$$

By substituting the values

$$\text{Number of wooden crates that can be stored in godown} = 15000 / 0.9375$$

So we get

$$\text{Number of wooden crates that can be stored in godown} = 16000$$

Therefore, the number of wooden crates that can be stored in the godown are 16000.

**6. How many planks of dimensions (5m × 25cm × 10cm) can be stored in a pit which is 20m long, 6m wide and 80cm deep?**

**Solution:**

The dimensions of the plank are

$$\text{Length} = 5\text{m} = 500\text{cm}$$

$$\text{Breadth} = 25\text{cm}$$

$$\text{Height} = 10\text{cm}$$

We know that

$$\text{Volume of the plank} = l \times b \times h$$

By substituting the values

$$\text{Volume of the plank} = 500 \times 25 \times 10$$

So we get

$$\text{Volume of the plank} = 125000 \text{ cm}^3$$

The dimensions of the pit are

$$\text{Length} = 20\text{m} = 2000 \text{ cm}$$

$$\text{Breadth} = 6\text{m} = 600 \text{ cm}$$

$$\text{Height} = 80\text{cm}$$

We know that

$$\text{Volume of one pit} = l \times b \times h$$

By substituting the values

$$\text{Volume of one pit} = 2000 \times 600 \times 80$$

So we get

$$\text{Volume of one pit} = 96000000 \text{ cm}^3$$

$$\text{So the number of planks that can be stored} = \text{Volume of one pit} / \text{Volume of plank}$$

By substituting the values

$$\text{Number of planks that can be stored} = 96000000 / 125000$$

So we get

$$\text{Number of planks that can be stored} = 768$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Therefore, the number of planks that can be stored is 768.

**7. How many bricks will be required to construct a wall 8m long, 6m high and 22.5cm thick if each brick measures (25cm × 11.25cm × 6cm)?**

**Solution:**

The dimensions of the wall are

Length = 8m = 800 cm

Breadth = 6m = 600 cm

Height = 22.5 cm

We know that

Volume of wall =  $l \times b \times h$

By substituting the values

Volume of wall =  $800 \times 600 \times 22.5$

By multiplication

Volume of wall =  $10800000 \text{ cm}^3$

The dimensions of brick are

Length = 25cm

Breadth = 11.25cm

Height = 6cm

We know that

Volume of brick =  $l \times b \times h$

By substituting the values

Volume of brick =  $25 \times 11.25 \times 6$

By multiplication

Volume of brick =  $1687.5 \text{ cm}^3$

So the number of bricks required = Volume of wall / Volume of brick

By substituting the values

Number of bricks required =  $10800000 / 1687.5$

By division

Number of bricks required = 6400

Therefore, the number of bricks required to construct a wall is 6400.

**8. Find the capacity of a closed rectangular cistern whose length is 8m, breadth 6m and depth 2.5m. Also, find the area of the iron sheet required to make the cistern.**

**Solution:**

The dimensions of the cistern are

Length = 8m

Breadth = 6m

Height = 2.5m

We know that

Capacity of cistern = volume of cistern

Volume of cistern =  $l \times b \times h$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

By substituting the values

$$\text{Volume of cistern} = 8 \times 6 \times 2.5$$

By multiplication

$$\text{Volume of cistern} = 120\text{m}^3$$

We know that the area of iron sheet required is equal to the total surface area of the cistern

So we get

$$\text{Total surface area} = 2 (lb + bh + lh)$$

By substituting the values

$$\text{Total surface area} = 2 (8 \times 6 + 6 \times 2.5 + 2.5 \times 8)$$

On further calculation

$$\text{Total surface area} = 2 (48 + 15 + 20)$$

So we get

$$\text{Total surface area} = 2 \times 83 = 166 \text{ m}^2$$

Therefore, the capacity of the cistern is  $120 \text{ m}^3$  and the area of the iron sheet required to make the cistern is  $166\text{m}^2$ .

**9. The dimensions of a room are  $(9\text{m} \times 8\text{m} \times 6.5\text{m})$ . It has one door of dimensions  $(2\text{m} \times 1.5\text{m})$  and two windows, each of dimensions  $(1.5\text{m} \times 1\text{m})$ . Find the cost of whitewashing the walls at ₹ 25 per square metre.**

**Solution:**

The dimensions of the room is

$$\text{Length} = 9\text{m}$$

$$\text{Breadth} = 8\text{m}$$

$$\text{Height} = 6.5\text{m}$$

We know that

$$\text{Area of four walls of the room} = 2 (l + b) \times h$$

By substituting the values

$$\text{Area of the four walls of the room} = 2 (9 + 8) \times 6.5$$

On further calculation

$$\text{Area of the four walls of the room} = 34 \times 6.5$$

So we get

$$\text{Area of the four walls of the room} = 221 \text{ m}^2$$

The dimensions of the door are

$$\text{Length} = 2\text{m}$$

$$\text{Breadth} = 1.5\text{m}$$

We know that

$$\text{Area of one door} = l \times b$$

By substituting the values

$$\text{Area of one door} = 2 \times 1.5$$

So we get

$$\text{Area of one door} = 3\text{m}^2$$

The dimensions of the window are

$$\text{Length} = 1.5\text{m}$$

$$\text{Breadth} = 1\text{m}$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

We know that

$$\text{Area of two windows} = 2 (l \times b)$$

By substituting the values

$$\text{Area of two windows} = 2 (1.5 \times 1)$$

On further calculation

$$\text{Area of two windows} = 2 \times 1.5 = 3\text{m}^2$$

So the area to be whitewashed = Area of four walls of the room – Area of one door – Area of two windows

By substituting the values

$$\text{Area to be whitewashed} = (221 - 3 - 3)$$

So we get

$$\text{Area to be whitewashed} = 215\text{m}^2$$

It is given that the cost of whitewashing = ₹ 25 per square metre

$$\text{So the cost of whitewashing } 215\text{m}^2 = ₹ (25 \times 215)$$

$$\text{Cost of whitewashing } 215\text{m}^2 = ₹ 5375$$

Therefore, the cost of whitewashing  $215\text{m}^2$  is ₹ 5375.

**10. A wall 15m long, 30cm wide and 4m high is made of bricks, each measuring (22cm × 12.5cm × 7.5cm). If 1/12 of the total volume of the wall consists of mortar, how many bricks are there in the wall?**

**Solution:**

The dimensions of the wall are

$$\text{Length} = 15\text{m}$$

$$\text{Breadth} = 0.3\text{m}$$

$$\text{Height} = 4\text{m}$$

We know that

$$\text{Volume of the wall} = l \times b \times h$$

By substituting the values

$$\text{Volume of the wall} = 15 \times 0.3 \times 4$$

So we get

$$\text{Volume of the wall} = 18\text{ m}^3$$

It is given that the wall consists of 1/12 mortar

So we get

$$\text{Volume of mortar} = 1/12 \times 18$$

By division

$$\text{Volume of mortar} = 1.5\text{ m}^3$$

So the volume of wall = Volume of wall – Volume of mortar

By substituting the values

$$\text{Volume of wall} = 18 - 1.5$$

By subtraction

$$\text{Volume of wall} = 16.5\text{ m}^3$$

The dimensions of the brick are

$$\text{Length} = 22\text{cm} = 0.22\text{ m}$$

$$\text{Breadth} = 12.5\text{ cm} = 0.125\text{ m}$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

$$\text{Height} = 7.5\text{cm} = 0.075 \text{ m}$$

We know that

$$\text{Volume of one brick} = l \times b \times h$$

By substituting the values

$$\text{Volume of one brick} = 0.22 \times 0.125 \times 0.075$$

So we get

$$\text{Volume of one brick} = 0.0020625 \text{ m}^3$$

So the number of bricks = Volume of bricks/ Volume of one brick

By substituting the values

$$\text{Number of bricks} = 16.5/0.0020625$$

So we get

$$\text{Number of bricks} = 8000$$

Therefore, the number of bricks in the wall are 8000.

**11. How many cubic centimetres of iron are there in an open box whose external dimensions are 36cm, 25cm and 16.5cm, the iron being 1.5cm thick throughout? If  $1\text{cm}^3$  of iron weighs 15g, find the weight of the empty box in kilograms.**

**Solution:**

The external dimensions of the box are

$$\text{Length} = 36\text{cm}$$

$$\text{Breadth} = 25\text{cm}$$

$$\text{Height} = 16.5\text{cm}$$

We know that

$$\text{External volume of the box} = l \times b \times h$$

By substituting the values

$$\text{External volume of the box} = 36 \times 25 \times 16.5$$

So we get

$$\text{External volume of the box} = 14850 \text{ cm}^3$$

It is given that the box is 1.5cm thick throughout

$$\text{Internal length of the box} = (36 - (1.5 \times 2))$$

So we get

$$\text{Internal length of the box} = 33 \text{ cm}$$

$$\text{Internal breadth of the box} = (25 - (1.5 \times 2))$$

So we get

$$\text{Internal breadth of the box} = 22\text{cm}$$

$$\text{Internal height of the box} = (16.5 - 1.5)$$

So we get

$$\text{Internal height of the box} = 15\text{cm}$$

We know that

$$\text{Internal Volume of the box} = l \times b \times h$$

By substituting the values

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Internal Volume of the box =  $33 \times 22 \times 15$

By multiplication

Internal volume of the box =  $10890 \text{ cm}^3$

So the volume of iron used in the box = External volume of box – internal volume of box

By substituting the values

Volume of iron used in the box =  $14850 - 10890 = 3960 \text{ cm}^3$

It is given that

Weight of  $1 \text{ cm}^3$  of iron =  $15 \text{ g} = 15/1000 \text{ kg}$

So the weight of  $3960 \text{ cm}^3$  of iron =  $3960 \times (15/1000)$

We get

Weight of  $3960 \text{ cm}^3$  of iron =  $59.4 \text{ kg}$

Therefore, the volume of iron used in the box is  $3960 \text{ cm}^3$  and the weight of the empty box is  $59.4 \text{ kg}$ .

**12. A box made of sheet metal costs ₹ 6480 at ₹ 120 per square metre. If the box is 5m long and 3m wide, find its height.**

**Solution:**

We know that

Area of sheet metal = Total cost/ Cost per  $\text{m}^2$

By substituting the values

Area of sheet metal =  $6480/120$

So we get

Area of sheet metal =  $54 \text{ m}^2$

So we get

Area of sheet metal =  $2 (lb + bh + hl)$

By substituting the values

$54 = 2 (5 \times 3 + 3 \times h + h \times 5)$

On further calculation

$27 = 15 + 3h + 5h$

So we get

$8h = 12$

By division

$h = 1.5 \text{ m}$

Therefore, the height of sheet metal is  $1.5 \text{ m}$ .

**13. The volume of a cuboid is  $1536 \text{ m}^3$ . Its length is  $16 \text{ m}$ , and its breadth and height are in the ratio 3:2. Find the breadth and height of the cuboid.**

**Solution:**

It is given that

Volume of cuboid =  $1536 \text{ m}^3$

Length of cuboid =  $16 \text{ m}$

Consider breadth as  $3x$  and height as  $2x$

We know that

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Volume of cuboid =  $l \times b \times h$

By substituting the values

$$1536 = 16 \times 3x \times 2x$$

On further calculation

$$1536 = 96x^2$$

So we get

$$x^2 = 1536/96$$

$$x^2 = 16$$

By taking the square root

$$x = \sqrt{16}$$

We get

$$x = 4\text{m}$$

Substituting the value of  $x$

$$\text{Breadth of cuboid} = 3x = 3(4) = 12\text{m}$$

$$\text{Height of cuboid} = 2x = 2(4) = 8\text{m}$$

Therefore, the breadth and height of the cuboid are 12m and 8m.

**14. How many persons can be accommodated in a dining hall of dimensions (20m × 16m × 4.5m), assuming that each person requires 5 cubic metres of air?**

**Solution:**

The dimensions of hall are

$$\text{Length} = 20\text{m}$$

$$\text{Breadth} = 16\text{m}$$

$$\text{Height} = 4.5\text{m}$$

We know that

$$\text{Volume of hall} = l \times b \times h$$

By substituting the values

$$\text{Volume of hall} = 20 \times 16 \times 4.5$$

So we get

$$\text{Volume of hall} = 1440 \text{ m}^3$$

It is given that volume of air for each person = 5 cubic metres

So the number of persons = volume of hall/ volume of air needed per person

By substituting the values

$$\text{Number of persons} = 1440/5$$

So we get

$$\text{Number of persons} = 288$$

**15. A classroom is 10m long, 6.4m wide and 5m high. If each student be given 1.6m<sup>2</sup> of the floor area, how many students can be accommodated in the room? How many cubic metres of air would each student get?**

**Solution:**

The dimensions of classroom are

$$\text{Length} = 10\text{m}$$

$$\text{Breadth} = 6.4\text{m}$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Height = 5m

It is given that the floor area for each student =  $1.6\text{m}^2$

So the number of students = area of room/floor area for each student

By substituting the values

$$\text{Number of students} = (10 \times 6.4)/1.6$$

So we get

$$\text{Number of students} = 40$$

So the air required by each student = Volume of room/ number of students

We know that Volume of room =  $l \times b \times h$

By substituting the values

$$\text{Volume of room} = 10 \times 6.4 \times 5 = 320\text{ m}^3$$

So we get

$$\text{Air required by each student} = 320/40 = 8\text{m}^3$$

Therefore, the number of students that can be accommodated in the room is 40 and the air required by each student is  $8\text{m}^3$ .

**16. The surface area of a cuboid is  $758\text{cm}^2$ . Its length and breadth are 14cm and 11cm respectively. Find its height.**

**Solution:**

It is given that

$$\text{Surface area of cuboid} = 758\text{ cm}^2$$

The dimensions of cuboid are

$$\text{Length} = 14\text{cm}$$

$$\text{Breadth} = 11\text{cm}$$

Consider h as the height of cuboid

We know that

$$\text{Surface area of cuboid} = 2(lb + bh + lh)$$

By substituting the values

$$758 = 2(14 \times 11 + 11 \times h + 14 \times h)$$

On further calculation

$$758 = 2(154 + 11h + 14h)$$

So we get

$$758 = 2(154 + 25h)$$

By multiplication

$$758 = 308 + 50h$$

It can be written as

$$50h = 758 - 308$$

By subtraction

$$50h = 450$$

By division

$$h = 9\text{cm}$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Therefore, the height of cuboid is 9cm.

**17. In a shower, 5cm of rain falls. Find the volume of water that falls on 2 hectares of ground.**

**Solution:**

We know that 1 hectare = 10000 m<sup>2</sup>

So we get

$$2 \text{ hectares} = 2 \times 10000 = 20000 \text{ m}^2$$

It is given that

$$\text{Depth of ground} = 5\text{cm} = 0.05\text{m}$$

We know that

$$\text{Volume of water} = \text{area} \times \text{depth}$$

By substituting the values

$$\text{Volume of water} = 20000 \times 0.05 = 1000 \text{ m}^3$$

Therefore, the volume of water that falls is 1000 m<sup>3</sup>.

**18. Find the volume, the lateral surface area, the total surface area and the diagonal of a cube, each of whose edges measures 9m. (Take  $\sqrt{3} = 1.73$ )**

**Solution:**

It is given that each edge of a cube = 9m

We know that

$$\text{Volume of cube} = a^3$$

By substituting the values

$$\text{Volume of cube} = 9^3$$

So we get

$$\text{Volume of cube} = 729 \text{ m}^3$$

We know that

$$\text{Lateral surface area of cube} = 4a^2$$

By substituting the values

$$\text{Lateral surface area of cube} = 4 \times 9^2$$

So we get

$$\text{Lateral surface area of cube} = 4 \times 81 = 324 \text{ m}^2$$

We know that

$$\text{Total surface area of cube} = 6a^2$$

By substituting the values

$$\text{Total surface area of cube} = 6 \times 9^2$$

So we get

$$\text{Total surface area of cube} = 6 \times 81 = 486 \text{ m}^2$$

We know that

$$\text{Diagonal of cube} = \sqrt{3} a$$

By substituting the values

$$\text{Diagonal of cube} = 1.73 \times 9 = 15.57 \text{ m}$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Therefore, the volume is  $729 \text{ m}^3$ , lateral surface area is  $324 \text{ m}^2$ , total surface area is  $486 \text{ m}^2$  and the diagonal of cube is  $15.57 \text{ m}$ .

**19. The total surface area of a cube is  $1176 \text{ cm}^2$ . Find its volume.**

**Solution:**

Consider a cm as each side of the cube

We know that

Total surface area of the cube  $= 6a^2$

By substituting the values

$$6a^2 = 1176$$

On further calculation

$$a^2 = 1176/6$$

So we get

$$a^2 = 196$$

By taking square root

$$a = \sqrt{196} = 14\text{cm}$$

We know that

Volume of cube  $= a^3$

By substituting the values

$$\text{Volume of cube} = 14^3$$

So we get

$$\text{Volume of cube} = 2744 \text{ cm}^3$$

Therefore, the volume of cube is  $2744 \text{ cm}^3$ .

**20. The lateral surface area of a cube is  $900 \text{ cm}^2$ . Find its volume.**

**Solution:**

Consider a cm as each side of the cube

We know that

Lateral surface area of cube  $= 4a^2$

By substituting the values

$$4a^2 = 900$$

On further calculation

$$a^2 = 900/4$$

By division

$$a^2 = 225$$

By taking square root

$$a = \sqrt{225} = 15\text{cm}$$

We know that

Volume of cube  $= a^3$

By substituting the values

$$\text{Volume of cube} = 15^3$$

So we get

$$\text{Volume of cube} = 3375 \text{ cm}^3$$

Therefore, the volume of cube is  $3375 \text{ cm}^3$ .

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

**21. The volume of a cube is  $512\text{cm}^3$ . Find its surface area.**

**Solution:**

It is given that

Volume of a cube =  $512\text{ cm}^3$

We know that

Volume of cube =  $a^3$

So we get

Each edge of the cube =  $\sqrt[3]{512} = 8\text{cm}$

We know that

Surface area of cube =  $6a^2$

By substituting the values

Surface area of cube =  $6 \times (8)^2$

So we get

Surface area of cube =  $6 \times 64 = 384\text{ cm}^2$

Therefore, the surface area of cube is  $384\text{ cm}^2$ .

**22. Three cubes of metal with edges 3cm, 4cm and 5cm respectively are melted to form a single cube. Find the lateral surface area of the new cube formed.**

**Solution:**

We know that

Volume of new cube =  $(3^3 + 4^3 + 5^3)$

So we get

Volume of new cube =  $27 + 64 + 125 = 216\text{ cm}^3$

Consider a cm as the edge of the cube

So we get

$a^3 = 216$

By taking cube root

$a = \sqrt[3]{216} = 6\text{cm}$

We know that

Lateral surface area of the new cube =  $4a^2$

By substituting the values

Lateral surface area of the new cube =  $4 \times (6)^2$

So we get

Lateral surface area of the new cube =  $4 \times 36 = 144\text{ cm}^2$

Therefore, the lateral surface area of the new cube formed is  $144\text{ cm}^2$ .

**23. Find the length of the longest pole that can be put in a room of dimensions  $(10\text{m} \times 10\text{m} \times 5\text{m})$ .**

**Solution:**

The dimensions of the room are

Length =  $10\text{m}$

Breadth =  $10\text{m}$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Height = 5m

We know that

Length of the longest pole = length of diagonal =  $\sqrt{l^2 + b^2 + h^2}$

By substituting the values

Length of the longest pole =  $\sqrt{10^2 + 10^2 + 5^2}$

So we get

Length of the longest pole =  $\sqrt{100 + 100 + 25}$

By addition

Length of the longest pole =  $\sqrt{225} = 15\text{m}$

Therefore, the length of the longest pole that can be put in the room is 15m.

**24. The sum of length, breadth and depth of a cuboid is 19cm and the length of its diagonal is 11cm. Find the surface area of the cuboid.**

**Solution:**

It is given that

$l + b + h = 19\text{cm} \dots\dots (1)$

Diagonal =  $\sqrt{l^2 + b^2 + h^2} = 11\text{cm} \dots\dots (2)$

Squaring on both sides of equation (1)

$(l + b + h)^2 = 19^2$

So we get

$(l^2 + b^2 + h^2) + 2(lb + bh + hl) = 361 \dots\dots (3)$

Squaring on both sides of equation (2)

$l^2 + b^2 + h^2 = 11^2 = 121 \dots\dots (4)$

Substituting equation (4) in (3)

$121 + 2(lb + bh + hl) = 361$

So we get

$2(lb + bh + hl) = 361 - 121$

By subtraction

$2(lb + bh + hl) = 240 \text{ cm}^2$

Therefore, the surface area of the cuboid =  $240 \text{ cm}^2$ .

**25. Each edge of a cube is increased by 50%. Find the percentage increase in the surface area of the cube.**

**Solution:**

Consider a cm as the edge of the cube

We know that

Surface area of cube =  $6a^2$

So we get

New edge =  $a + 50\%$  of  $a$

It can be written as

New edge =  $a + 50/100 a$

By LCM

## RS Aggarwal Solutions for Class 9 Maths Chapter 15 – Volume and Surface Area of Solids

New edge =  $150/100 a$

We get

New edge =  $3/2 a$  cm

So the new surface area =  $6 (3/2 a)^2$

We get

New surface area =  $6 \times 9/4 a^2 = 27/2 a^2 \text{ cm}^2$

Increased surface area = new surface area – surface area

So we get

Increased surface area =  $27/2 a^2 - 6a^2 = 15/2 a^2 \text{ cm}^2$

So the percentage increase in surface area =  $(\text{increased surface area}/\text{original surface area}) \times 100$

By substituting the values

Percentage increase in surface area =  $(15/2 a^2 / 6a^2) \times 100$

It can be written as

Percentage increase in surface area =  $15/2 a^2 \times 1/6a^2 \times 100$

So we get

Percentage increase in surface area = 125%

Therefore, the percentage increase in the surface area of the cube is 125%.

**26. If V is the volume of a cuboid of dimensions a, b, c and S is its surface area then prove that  $1/V = 2/S (1/a + 1/b + 1/c)$ .**

**Solution:**

We know that

Volume of a cuboid =  $a \times b \times c$

Surface area of cuboid =  $2 (ab + bc + ac)$

So we get

$2/s (1/a + 1/b + 1/c) = 2/s ((bc + ac + ab)/abc)$

It can be written as

$2/s (1/a + 1/b + 1/c) = 2/s (s/2V)$

On further calculation

$2/s (1/a + 1/b + 1/c) = 1/V$

We get

$1/V = 2/S (1/a + 1/b + 1/c)$

Therefore, it is proved that  $1/V = 2/S (1/a + 1/b + 1/c)$ .

**27. Water in a canal, 30dm wide and 12dm deep, is flowing with a velocity of 20km per hour. How much area will it irrigate, if 9cm of standing water is desired?**

**Solution:**

We know that water in a canal forms a cuboid

The dimensions are

Breadth = 30dm = 3m

Height = 12dm = 1.2m

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

We know that

Length = distance covered by water in 3 minutes = velocity of water in m/hr  $\times$  time in hours

By substituting the values

$$\text{Length} = 20000 \times (30/60)$$

So we get

$$\text{Length} = 10000\text{m}$$

We know that

Volume of water flown in 30 minutes =  $l \times b \times h$

By substituting the values

$$\text{Volume of water flown in 30 minutes} = 10000 \times 3 \times 1.2 = 36000 \text{ m}^3$$

Consider  $A \text{ m}^2$  as the area irrigated

So we get

$$A \times (9/100) = 36000$$

On further calculation

$$A = 400000 \text{ m}^2$$

Therefore, the area to be irrigated is  $400000 \text{ m}^2$ .

**28. A solid metallic cuboid of dimensions (9m  $\times$  8m  $\times$  2m) is melted and recast into solid cubes of edge 2m. Find the number of cubes so formed.**

**Solution:**

The dimensions of cuboid are

Length = 9m

Breadth = 8m

Height = 2m

We know that

Volume of cuboid =  $l \times b \times h$

By substituting the values

$$\text{Volume of cuboid} = 9 \times 8 \times 2$$

So we get

$$\text{Volume of cuboid} = 144 \text{ m}^3$$

We know that

Volume of each cube of edge 2m =  $a^3$

So we get

$$\text{Volume of each cube of edge 2m} = 2^3 = 8 \text{ m}^3$$

So the number of cubes formed = volume of cuboid / volume of each cube

By substituting the values

$$\text{Number of cubes formed} = 144/8 = 18$$

Therefore, the number of cubes formed is 18.

RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**EXERCISE 15(B)**

PAGE: 573

**1. The diameter of a cylinder is 28cm and its height is 40cm. Find the curved surface area, total surface area and the volume of the cylinder.**

**Solution:**

It is given that

Diameter of a cylinder = 28cm

We know that radius = diameter/2 = 28/2 = 14cm

Height of a cylinder = 40cm

We know that

Curved surface area =  $2\pi rh$

By substituting the values

Curved surface area =  $2 \times (22/7) \times 14 \times 40$

So we get

Curved surface area = 3520 cm<sup>2</sup>

We know that

Total surface area =  $2\pi rh + 2\pi r^2$

By substituting the values

Total surface area =  $(2 \times (22/7) \times 14 \times 40) + (2 \times (22/7) \times 14^2)$

On further calculation

Total surface area = 3520 + 1232 = 4752 cm<sup>2</sup>

We know that

Volume of cylinder =  $\pi r^2 h$

By substituting the values

Volume of cylinder =  $(22/7) \times 14^2 \times 40$

So we get

Volume of cylinder = 24640cm<sup>3</sup>

Therefore, the curved surface area, total surface area and the volume of cylinder are 3520 cm<sup>2</sup>, 4752 cm<sup>2</sup> and 24640cm<sup>3</sup>.

**2. A patient in a hospital is given soup daily in a cylindrical bowl of diameter 7cm. If the bowl is filled with soup to a height of 4cm, how much soup the hospital has to prepare daily to serve 250 patients?**

**Solution:**

It is given that

Diameter of the bowl = 7cm

We know that

Radius of the bowl = 7/2 = 3.5cm

Height = 4cm

We know that

Volume of soup in one bowl =  $\pi r^2 h$

By substituting the values

Volume of soup in one bowl =  $(22/7) \times (3.5)^2 \times 4$

So we get

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Volume of soup in one bowl =  $154\text{cm}^3$

So the volume of soup in 250 bowls =  $250 \times 154$

On further calculation

Volume of soup in 250 bowls =  $38500\text{ cm}^3 = 38.5\text{ litres}$

Therefore, the hospital must prepare 38.5 litres of soup daily to serve 250 patients.

**3. The pillars of a temple are cylindrically shaped. Each pillar has a circular base of radius 20cm and height 10m. How much concrete mixture would be required to build 14 such pillars?**

**Solution:**

It is given that

Radius of pillar =  $20\text{cm} = 0.2\text{m}$

Height of pillar =  $10\text{m}$

We know that

Volume of one pillar =  $\pi r^2 h$

By substituting the values

Volume of one pillar =  $(22/7) \times (0.2)^2 \times 10$

So we get

Volume of one pillar =  $1.2571\text{ m}^3$

So the volume of concrete mixture in 14 pillars =  $14 \times 1.2571 = 17.6\text{m}^3$

Therefore, the volume of concrete mixture required in 14 pillars is  $17.6\text{m}^3$ .

**4. A soft drink is available in two packs:**

**(i) a tin can with a rectangular base of length 5cm, breadth 4cm and height 15cm, and**

**(ii) a plastic cylinder with circular base of diameter 7cm and height 10cm.**

**Which container has greater capacity and by how much?**

**Solution:**

(i) The dimensions for a tin can with a rectangular base is

Length =  $5\text{cm}$

Breadth =  $4\text{cm}$

Height =  $15\text{cm}$

We know that

Volume of tin can =  $l \times b \times h$

By substituting the values

Volume of tin can =  $5 \times 4 \times 15$

So we get

Volume of tin can =  $300\text{ cm}^3$

(ii) The dimensions for cylinder with circular base

Diameter =  $7\text{cm}$

We know that radius =  $7/2 = 3.5\text{ cm}$

Height =  $10\text{cm}$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

We know that

$$\text{Volume of cylinder} = \pi r^2 h$$

By substituting the values

$$\text{Volume of cylinder} = (22/7) \times (3.5)^2 \times 10$$

So we get

$$\text{Volume of cylinder} = 385 \text{ cm}^3$$

We know that the volume of plastic cylinder is greater than volume of tin can

$$\text{So difference in volume} = 385 - 300 = 85 \text{ cm}^3$$

Therefore, a plastic cylinder has greater capacity than a tin can by  $85 \text{ cm}^3$ .

**5. There are 20 cylindrical pillars in a building, each having a diameter of 50cm and height 4m. Find the cost of cleaning them at ₹ 14 per  $\text{m}^2$ .**

**Solution:**

It is given that

$$\text{Diameter of one pillar} = 50\text{cm} = 0.5\text{m}$$

$$\text{So the radius of one pillar} = 0.5/2 = 0.25\text{m}$$

$$\text{Height of one pillar} = 4\text{m}$$

We know that

$$\text{Lateral surface area of one pillar} = 2 \pi r h$$

By substituting the values

$$\text{Lateral surface area of one pillar} = 2 \times (22/7) \times 0.25 \times 4$$

So we get

$$\text{Lateral surface area of one pillar} = 6.285 \text{ m}^2$$

$$\text{So the lateral surface area of 20 pillars} = 20 \times 6.285 = 125.714 \text{ m}^2$$

$$\text{It is given that the cost of cleaning} = ₹ 14 \text{ per m}^2$$

$$\text{So the cost of cleaning } 125.714 \text{ m}^2 = ₹ (14 \times 125.714)$$

We get

$$\text{Cost of cleaning } 125.714 \text{ m}^2 = ₹ 1760$$

Therefore, the cost of cleaning  $125.714 \text{ m}^2$  is ₹ 1760.

**6. The curved surface area of a right circular cylinder is  $4.4 \text{ m}^2$ . If the radius of its base is  $0.7\text{m}$ , find its**

**(i) height and**

**(ii) volume.**

**Solution:**

It is given that

$$\text{Curved surface area of a cylinder} = 4.4 \text{ m}^2$$

$$\text{Radius of the cylinder} = 0.7\text{m}$$

(i) We know that

$$\text{Curved surface area of a cylinder} = 2 \pi r h$$

By substituting the values

$$4.4 = 2 \times (22/7) \times 0.7 \times h$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

On further calculation

$$4.4 = 2 \times 22 \times 0.1 \times h$$

So we get

$$h = 4.4 / (2 \times 22 \times 0.1)$$

By division

$$h = 1\text{m}$$

(ii) We know that

$$\text{Volume of a cylinder} = \pi r^2 h$$

By substituting the values

$$\text{Volume of a cylinder} = (22/7) \times (0.7)^2 \times 1$$

So we get

$$\text{Volume of a cylinder} = 1.54 \text{ m}^3$$

**7. The lateral surface area of a cylinder is  $94.2 \text{ cm}^2$  and its height is  $5\text{cm}$ . Find**

**(i) the radius of its base and**

**(ii) its volume. (Take  $\pi = 3.14$ )**

**Solution:**

It is given that

$$\text{Lateral surface area of a cylinder} = 94.2 \text{ cm}^2$$

$$\text{Height} = 5\text{cm}$$

(i) We know that

$$\text{Lateral surface area of cylinder} = 2 \pi r h$$

By substituting the values

$$94.2 = 2 \times 3.14 \times r \times 5$$

On further calculation

$$r = 94.2 / (2 \times 3.14 \times 5)$$

So we get

$$r = 3\text{cm}$$

(ii) We know that

$$\text{Volume of a cylinder} = \pi r^2 h$$

By substituting the values

$$\text{Volume of a cylinder} = (3.14) \times (3)^2 \times 5$$

So we get

$$\text{Volume of a cylinder} = 141.3 \text{ cm}^3$$

**8. The capacity of a closed cylindrical vessel of height  $1\text{m}$  is  $15.4$  litres. Find the area of the metal sheet needed to make it.**

**Solution:**

It is given that

$$\text{Volume of the cylindrical vessel} = 15.4 \text{ litres} = 15400 \text{ cm}^3$$

$$\text{Height of the cylindrical vessel} = 1\text{m} = 100\text{cm}$$

We know that

$$\text{Volume of a cylinder} = \pi r^2 h$$

By substituting the values

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

$$15400 = (22/7) \times r^2 \times 100$$

On further calculation

$$r^2 = (15400 \times 7) / (22 \times 100)$$

So we get

$$r^2 = 49$$

By taking square root

$$r = \sqrt{49} = 7\text{cm}$$

So area of metal sheet needed = total surface area of cylinder

It can be written as

$$\text{Area of metal sheet needed} = 2\pi r(h + r)$$

By substituting the values

$$\text{Area of metal sheet needed} = 2 \times (22/7) \times 7(100 + 7)$$

On further calculation

$$\text{Area of metal sheet needed} = 2 \times 22 \times 107$$

So we get

$$\text{Area of metal sheet needed} = 4708 \text{ cm}^2$$

Therefore, the area of metal sheet needed is  $4708 \text{ cm}^2$ .

**9. The inner diameter of a cylindrical wooden pipe is 24cm and its outer diameter is 28cm. The length of the pipe is 35cm. Find the mass of the pipe, if  $1\text{cm}^3$  of wood has a mass of 0.6g.**

**Solution:**

The dimensions of a cylinder are

Internal diameter = 24cm

Internal radius =  $24/2 = 12\text{cm}$

External diameter = 28cm

External radius =  $28/2 = 14\text{cm}$

Length = 35cm

We know that

$$\text{Volume of pipe} = \text{Volume of cylinder} = \pi(R^2 - r^2)h$$

By substituting the values

$$\text{Volume of pipe} = ((22/7) \times (14^2 - 12^2) \times 35)$$

On further calculation

$$\text{Volume of pipe} = 22 \times (196 - 144) \times 5$$

So we get

$$\text{Volume of pipe} = 22 \times 52 \times 5$$

By multiplication

$$\text{Volume of pipe} = 5720 \text{ cm}^3$$

It is given that  $1\text{cm}^3$  of wood has a mass of 0.6g

$$\text{So the mass of pipe} = 5720 \times 0.6 = 3432\text{g} = 3.432\text{kg}$$

Therefore, the mass of pipe is 3.432kg.

**10. In a water heating system, there is a cylindrical pipe of length 28m and diameter 5cm. Find the total radiating surface in the system.**

**Solution:**

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

The dimensions of cylindrical pipe

Diameter = 5cm

Radius =  $5/2 = 2.5\text{cm}$

Height = 28m = 2800cm

We know that

Total radiating surface in the system = curved surface area of cylindrical pipe =  $2\pi rh$

By substituting the values

Total radiating surface in the system =  $2 \times (22/7) \times 2.5 \times 2800$

So we get

Total radiating surface in the system =  $44000\text{ cm}^2$

Therefore, the total radiating surface in the system is  $44000\text{ cm}^2$ .

**11. Find the weight of a solid cylinder of radius 10.5cm and height 60cm if the material of the cylinder weighs 5g per  $\text{cm}^3$ .**

**Solution:**

It is given that

Radius of cylinder = 10.5cm

Height of cylinder = 60cm

We know that

Volume of cylinder =  $\pi r^2 h$

By substituting the values

Volume of cylinder =  $(22/7) \times (10.5)^2 \times 60$

So we get

Volume of cylinder =  $20790\text{ cm}^3$

So the weight of the cylinder if the material weighs 5 g per  $\text{cm}^3 = 20790 \times 5 = 103950\text{g}$

We know that  $1000\text{g} = 1\text{kg}$

Weight of the cylinder =  $103950/1000 = 103.95\text{kg}$

Therefore, the weight of solid cylinder is 103.95kg.

**12. The curved surface area of a cylinder is  $1210\text{ cm}^2$  and its diameter is 20cm. Find its height and volume.**

**Solution:**

It is given that

Curved surface area =  $1210\text{ cm}^2$

Diameter of the cylinder = 20cm

Radius of the cylinder =  $20/2 = 10\text{cm}$

We know that

Curved surface area of the cylinder =  $2\pi rh$

By substituting the values

$1210 = 2 \times (22/7) \times 10 \times h$

So we get

$h = (1210 \times 7) / (2 \times 22 \times 10) = 19.25\text{cm}$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

We know that

$$\text{Volume of cylinder} = \pi r^2 h$$

By substituting the values

$$\text{Volume of cylinder} = (22/7) \times (10)^2 \times 19.25$$

So we get

$$\text{Volume of cylinder} = 6050 \text{ cm}^3$$

Therefore, the height of cylinder is 19.25cm and the volume is 6050 cm<sup>3</sup>.

**13. The curved surface area of a cylinder is 4400 cm<sup>2</sup> and the circumference of its base is 110cm. Find the height and the volume of the cylinder.**

**Solution:**

Consider r as the radius as h as the height of cylinder

It is given that

$$\text{Surface area of cylinder} = 2 \pi r h$$

By substituting the values

$$2 \pi r h = 4400 \dots\dots (1)$$

It is given that circumferences of its base =  $2 \pi r$

So we get

$$2 \pi r = 110$$

We know that

$$2 \pi r h / 2 \pi r = 4400 / 110$$

On further calculation

$$h = 40 \text{ cm}$$

Substituting the value of h in (1)

We get

$$2 \times (22/7) \times r \times 40 = 4400$$

On further calculation

$$r = (4400 \times 7) / (44 \times 40)$$

So we get

$$r = 17.5 \text{ cm}$$

We know that

$$\text{Volume of cylinder} = \pi r^2 h$$

By substituting the values

$$\text{Volume of cylinder} = (22/7) \times (17.5)^2 \times 40$$

So we get

$$\text{Volume of cylinder} = 38500 \text{ cm}^3$$

Therefore, the height of the cylinder is 40cm and the volume is 38500 cm<sup>3</sup>.

**14. The radius of the base and the height of a cylinder are in the ratio 2: 3. If its volume is 1617cm<sup>3</sup>, find the total surface area of the cylinder.**

**Solution:**

Consider radius as 2x cm and height as 3x cm

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

We know that

$$\text{Volume of cylinder} = \pi r^2 h$$

By substituting the values

$$\text{Volume of cylinder} = (22/7) \times (2x)^2 \times 3x$$

On further calculation

$$\text{Volume of cylinder} = (22/7) \times 4x^2 \times 3x$$

So we get

$$\text{Volume of cylinder} = (22/7) \times 12x^3$$

It can be written as

$$1617 = (22/7) \times 12x^3$$

On further calculation

$$12x^3 = (1617 \times 7)/22$$

So we get

$$x^3 = (1617 \times 7)/(22 \times 12)$$

$$x^3 = 42.875$$

By taking cube root

$$x = \sqrt[3]{42.875}$$

We get

$$x = 3.5$$

By substituting the value of x

$$\text{Radius} = 2x = 2(3.5) = 7\text{cm}$$

$$\text{Height} = 3x = 3(3.5) = 10.5\text{cm}$$

We know that

$$\text{Total surface area} = 2\pi r(h + r)$$

By substituting the values

$$\text{Total surface area} = 2 \times (22/7) \times 7(10.5 + 7)$$

On further calculation

$$\text{Total surface area} = 44 \times 17.5$$

So we get

$$\text{Total surface area} = 770 \text{ cm}^2$$

Therefore, the total surface area of the cylinder is  $770 \text{ cm}^2$ .

**15. The total surface area of a cylinder is  $462 \text{ cm}^2$ . Its curved surface area is one third of its total surface area. Find the volume of the cylinder.**

**Solution:**

We know that

$$\text{Curved surface area} = 1/3 \times \text{Total surface area}$$

By substituting the values

$$\text{Curved surface area} = 1/3 \times 462$$

So we get

$$\text{Curved surface area} = 154 \text{ cm}^2$$

$$\text{So the total surface area} - \text{curved surface area} = 462 - 154 = 308 \text{ cm}^2$$

We know that

$$2\pi r^2 = 308$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

By substituting the values

$$2 \times (22/7) \times r^2 = 308$$

On further calculation

$$r^2 = (308 \times 7)/44$$

So we get

$$r^2 = 49$$

By taking square root

$$r = \sqrt{49} = 7\text{cm}$$

We know that

$$\text{Curved surface area} = 2 \pi r h$$

By substituting the values

$$154 = 2 \times (22/7) \times 7 \times h$$

So we get

$$h = 154/44$$

By division

$$h = 3.5 \text{ cm}$$

So we get  $r = 7\text{cm}$  and  $h = 3.5 \text{ cm}$

We know that

$$\text{Volume of the cylinder} = \pi r^2 h$$

By substituting the values

$$\text{Volume of cylinder} = (22/7) \times (7)^2 \times 3.5$$

So we get

$$\text{Volume of cylinder} = 539 \text{ cm}^3$$

Therefore, volume of the cylinder is  $539 \text{ cm}^3$ .

**16. The total surface area of a solid cylinder is  $231 \text{ cm}^2$  and its curved surface area is  $2/3$  of the total surface area. Find the volume of the cylinder.**

**Solution:**

We know that

$$\text{Curved surface area} = 2/3 \times \text{Total surface area}$$

By substituting the values

$$\text{Curved surface area} = 2/3 \times 231$$

So we get

$$\text{Curved surface area} = 154 \text{ cm}^2$$

$$\text{So the total surface area} - \text{curved surface area} = 231 - 154 = 77 \text{ cm}^2$$

We know that

$$2 \pi r^2 = 77$$

By substituting the values

$$2 \times (22/7) \times r^2 = 77$$

On further calculation

$$r^2 = (77 \times 7)/44$$

So we get

$$r^2 = 49/4$$

By taking square root

$$r = \sqrt{49/4} = 7/2 \text{ cm}$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

We know that

$$\text{Curved surface area} = 2\pi rh$$

By substituting the values

$$154 = 2 \times (22/7) \times (7/2) \times h$$

So we get

$$h = 154/22$$

By division

$$h = 7 \text{ cm}$$

So we get  $r = 7/2 \text{ cm}$  and  $h = 7 \text{ cm}$

We know that

$$\text{Volume of the cylinder} = \pi r^2 h$$

By substituting the values

$$\text{Volume of cylinder} = (22/7) \times (7/2)^2 \times 7$$

So we get

$$\text{Volume of cylinder} = 269.5 \text{ cm}^3$$

Therefore, volume of the cylinder is  $269.5 \text{ cm}^3$ .

**17. The ratio between the curved surface area and the total surface area of a right circular cylinder is 1: 2. Find the volume of the cylinder if its total surface area is  $616 \text{ cm}^2$ .**

**Solution:**

We know that

$$\text{Curved surface area} = 2\pi rh$$

It is given that the ratio of curved surface area and total surface area is 1: 2

So we get

$$2\pi rh / 2\pi r(h + r) = 1/2$$

On further calculation

$$h / (h + r) = 1/2$$

It can be written as

$$2h = h + r$$

So we get

$$2h - h = r$$

$$h = r$$

By substituting  $h = r$  we get

$$2\pi r(h + r) = 616$$

So we get

$$4\pi r^2 = 616$$

It can be written as

$$4 \times (22/7) \times r^2 = 616$$

On further calculation

$$r^2 = (616 \times 7) / 88$$

We get

$$r^2 = 49$$

By taking out square root

$$r = \sqrt{49} = 7 \text{ cm}$$

We know that

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

$$\text{Volume} = \pi r^2 h$$

By substituting the values

$$\text{Volume of cylinder} = (22/7) \times (7)^2 \times 7$$

So we get

$$\text{Volume of cylinder} = 1078 \text{ cm}^3$$

Therefore, volume of the cylinder is  $1078 \text{ cm}^3$ .

**18. A cylindrical bucket, 28cm in diameter and 72cm high, is full of water. The water is emptied into a rectangular tank, 66cm long and 28cm wide. Find the height of the water level in the tank.**

**Solution:**

It is given that

Diameter of the bucket = 28cm

Radius =  $28/2 = 14\text{cm}$

Height of the bucket = 72cm

Length of the tank = 66cm

Breadth of tank = 28cm

We know that

Volume of tank = volume of cylindrical bucket

$$l \times b \times h = \pi r^2 h$$

By substituting the values

$$66 \times 28 \times h = (22/7) \times (14)^2 \times 72$$

On further calculation

$$h = (22 \times 2 \times 14 \times 72) / (66 \times 28)$$

So we get

$$h = 24\text{cm}$$

Therefore, the height of the water level in the tank is 24cm.

**19. The barrel of a fountain pen, cylindrical in shape, is 7cm long and 5mm in diameter. A full barrel of ink in the pen will be used up on writing 330 words on an average. How many words would use up a bottle of ink containing one fifth of a litre?**

**Solution:**

The dimensions of barrel are

Length = 7cm

Diameter = 5mm

Radius =  $5/2 = 2.5 \text{ mm} = 0.25\text{cm}$

We know that

$$\text{Volume of barrel} = \pi r^2 h$$

By substituting the values

$$\text{Volume of cylinder} = (22/7) \times (0.25)^2 \times 7$$

So we get

$$\text{Volume of cylinder} = 1.375 \text{ cm}^3$$

So  $1.375 \text{ cm}^3$  is used for writing 330 words

## RS Aggarwal Solutions for Class 9 Maths Chapter 15 – Volume and Surface Area of Solids

So the bottle containing one fifth of a litre ink would write =  $330 \times (1/1.375) \times (1/5) \times 1000 = 48000$  words

Therefore, a bottle of ink containing one fifth of a litre would write 48000 words.

**20.  $1\text{cm}^3$  of gold is drawn into a wire 0.1mm in diameter. Find the length of the wire.**

**Solution:**

We know that

$$1\text{cm}^3 = 1\text{cm} \times 1\text{cm} \times 1\text{cm}$$

$$1\text{cm} = 0.01\text{m}$$

So the volume of gold =  $0.01\text{m} \times 0.01\text{m} \times 0.01\text{m}$

We get

$$\text{Volume of gold} = 0.000001\text{m}^3 \dots\dots (1)$$

It is given that

Diameter of the wire drawn = 0.1mm

So the radius =  $0.1/2 = 0.05\text{mm} = 0.00005\text{ m} \dots\dots\dots (2)$

Consider length of the wire =  $h\text{ m} \dots\dots\dots (3)$

We know that

Volume of wire drawn = Volume of gold

By substituting the values using (1), (2) and (3)

$$\pi r^2 h = 0.000001$$

On further calculation

$$\pi \times 0.00005 \times 0.00005 \times h = 0.000001$$

So we get

$$h = (0.000001 \times 7) / (0.00005 \times 0.00005 \times 22) = 127.27\text{m}$$

Therefore, the length of the wire is 127.27m.

**21. If  $1\text{cm}^3$  of cast iron weighs 21g, find the weight of a cast iron pipe of length 1m with a bore of 3cm in which the thickness of the metal is 1cm.**

**Solution:**

We know that

$$\text{Internal radius} = 3/2 = 1.5\text{cm}$$

$$\text{External radius} = 1.5 + 1 = 2.5\text{cm}$$

We know that

$$\text{Volume of cast iron} = (\pi \times (2.5)^2 \times 100 - \pi \times (1.5)^2 \times 100)$$

Taking the common terms out

$$\text{Volume of cast iron} = \pi \times 100 \times (2.5^2 - 1.5^2)$$

On further calculation

$$\text{Volume of cast iron} = (22/7) \times 100 \times (6.25 - 2.25)$$

So we get

$$\text{Volume of cast iron} = (22/7) \times 100 \times 4 = 1257.142\text{ cm}^3$$

It is given that  $1\text{cm}^3$  of cast iron weighs 21g

We know that  $1\text{kg} = 1000\text{g}$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

So the weight of cast iron pipe =  $1257.142 \times (21/1000) = 26.4\text{kg}$

Therefore, the weight of cast iron pipe is 26.4kg.

**22. A cylindrical tube, open at both ends, is made of metal. The internal diameter of the tube is 10.4cm and its length is 25cm. The thickness of the metal is 8mm everywhere. Calculate the volume of the metal.**

**Solution:**

It is given that

Internal diameter of the tube = 10.4cm

Internal radius of the tube =  $10.4/2 = 5.2\text{ cm}$

Length = 25cm

We know that

External radius =  $5.2 + 0.8 = 6\text{cm}$

We know that

Required volume =  $(\pi \times 6^2 \times 25 - \pi \times 5.2^2 \times 25)$

Taking the common terms out

Required volume =  $\pi \times 25 \times (6^2 - 5.2^2)$

On further calculation

Required volume =  $(22/7) \times 25 \times (36 - 27.04)$

So we get

Required volume =  $(22/7) \times 25 \times 8.96 = 704\text{ cm}^3$

Therefore, the volume of the metal is  $704\text{ cm}^3$ .

**23. It is required to make a closed cylindrical tank of height 1m and base diameter 140cm from a metal sheet. How many square metres of the sheet are required for the same?**

**Solution:**

It is given that

Diameter of the cylinder = 140cm

Radius of the cylinder =  $140/2 = 70\text{cm}$

Height of the cylinder = 1m = 100cm

We know that

Area of sheet required = Total surface area of cylinder =  $2\pi r(h + r)$

By substituting the values

Area of sheet required =  $2 \times (22/7) \times 70 (100 + 70)$

On further calculation

Area of sheet required =  $2 \times 22 \times 10 \times 170$

So we get

Area of sheet required =  $74800\text{ cm}^2 = 7.48\text{ m}^2$

Therefore, the area of sheet required is  $7.48\text{ m}^2$ .

**24. A juice seller has a large cylindrical vessel of base radius 15cm filled up to a height of 32cm with orange juice. The juice is filled in small cylindrical glasses of radius 3cm up to a height of 8cm, and sold for ₹ 15 each. How much money does he receive by selling the juice completely?**

**Solution:**

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

The dimensions of the cylindrical vessel

Radius = 15cm

Height = 32cm

We know that

Volume of cylindrical vessel =  $\pi r^2 h$

By substituting the values

Volume of cylindrical vessel =  $(22/7) \times (15)^2 \times 32$

So we get

Volume of cylindrical vessel = 22628.571 cm<sup>3</sup>

The dimensions of cylindrical glass are

Radius = 3cm

Height = 8cm

We know that

Volume of each small cylindrical glass =  $\pi r^2 h$

By substituting the values

Volume of each small cylindrical glass =  $(22/7) \times (3)^2 \times 8$

So we get

Volume of each small cylindrical glass = 226.28 cm<sup>3</sup>

So the number of small glasses filled = volume of cylindrical vessel / volume of each glass

By substituting the values

Number of small glasses filled = 22628.571 / 226.28 = 100

It is given that

Cost of 1 glass = ₹ 15

So the cost of 100 glasses = ₹ (15 × 100) = ₹ 1500

Therefore, the juice seller receives ₹ 1500 by selling 100 glasses of orange juice.

**25. A well with inside diameter 10m is dug 8.4m deep. Earth taken out of it is spread all around it to a width of 7.5m to form an embankment. Find the height of the embankment.**

**Solution:**

The dimensions of the well are

Radius = 5m

Depth = 8.4m

We know that

Volume of the earth dug out = Volume of well =  $\pi r^2 h$

By substituting the values

Volume of the earth dug out =  $(22/7) \times (5)^2 \times 8.4$

So we get

Volume of the earth dug out = 660 m<sup>3</sup>

It is given that

Width of embankment = 7.5m

We know that

## RS Aggarwal Solutions for Class 9 Maths Chapter 15 – Volume and Surface Area of Solids

External radius of embankment  $R = 5 + 7.5 = 12.5\text{m}$

Internal radius of embankment  $r = 5\text{m}$

We know that

$$\text{Area of embankment} = \pi (R^2 - r^2)$$

By substituting the values

$$\text{Area of embankment} = (22/7) \times (12.5^2 - 5^2)$$

On further calculation

$$\text{Area of embankment} = (22/7) \times (156.25 - 25)$$

So we get

$$\text{Area of embankment} = (22/7) \times 131.25 = 412.5 \text{ m}^2$$

We know that

$$\text{Volume of embankment} = \text{volume of earth dug out} = 660 \text{ m}^3$$

$$\text{So the height of embankment} = \text{volume of embankment} / \text{area of embankment}$$

By substituting the values

$$\text{Height of embankment} = 660 / 412.5 = 1.6\text{m}$$

Therefore, the height of the embankment is 1.6m.

**26. How many litres of water flows out of a pipe having an area of cross section of  $5\text{cm}^2$  in 1 minute, if the speed of water in the pipe is  $30\text{cm/sec}$ ?**

**Solution:**

It is given that

$$\text{Speed of water in the pipe} = 30\text{cm/sec}$$

We know that

$$\text{Volume of water that flows out of the pipe in one second} = \text{area of cross section} \times \text{length of water flown in one second}$$

By substituting the values

$$\text{Volume of water that flows out of the pipe in one second} = 5 (30) = 150\text{cm}^3$$

$$\text{So the volume of water that flows out of the pipe in one minute} = 150 (60) = 9000 \text{ cm}^3 = 9 \text{ litres}$$

Therefore, 9 litres of water flows out of the pipe in one minute.

**27. A cylindrical water tank of diameter 1.4m and height 2.1m is being fed by a pipe of diameter 3.5cm through which water flows at the rate of 2m per second. In how much time will the tank be filled?**

**Solution:**

Consider the tank to be filled in  $x$  minutes

We know that

$$\text{Volume of water that flows through the pipe in } x \text{ minutes} = \text{Volume of tank}$$

By substituting the values

$$\pi \times (3.5 / (2 \times 100))^2 \times (2 \times 60x) = \pi \times (0.7)^2 \times 2.1$$

On further calculation

$$0.115395x = 3.23106$$

So we get

$$x = 28$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Therefore, the tank will be filled in 28 minutes.

**28. A cylindrical container with diameter of base 56cm contains sufficient water to submerge a rectangular solid of iron with dimensions (32cm × 22cm × 14cm). Find the rise in the level of water when the solid is completely submerged.**

**Solution:**

Consider  $h$  cm as the rise in level of water

We know that

Volume of cylinder of height  $h$  and base radius 28cm = volume of rectangular iron solid

By substituting the values

$$(22/7) \times 28^2 \times h = 32 \times 22 \times 14$$

On further calculation

$$22 \times 28 \times 4 \times h = 32 \times 22 \times 14$$

So we get

$$h = (32 \times 22 \times 14) / (22 \times 28 \times 4)$$

By division

$$h = 4\text{cm}$$

Therefore, the rise in the level of water when the solid is completely submerged is 4cm.

**29. Find the cost of sinking a tube-well 280m deep, having a diameter 3m at the rate of ₹ 15 per cubic metre. Find also the cost of cementing its inner curved surface at ₹ 10 per square metre.**

**Solution:**

It is given that

$$\text{Radius} = 1.5\text{m}$$

$$\text{Height} = 280\text{m}$$

We know that

$$\text{Volume of the tube well} = \pi r^2 h$$

By substituting the values

$$\text{Volume of the tube well} = (22/7) \times (1.5)^2 \times 280$$

So we get

$$\text{Volume of the tube well} = 1980 \text{ m}^3$$

It is given that

$$\text{Cost of sinking the tube well} = ₹ (15 \times 1980) = ₹ 29700$$

We know that

$$\text{Curved surface area of tube well} = 2 \pi r h$$

By substituting the values

$$\text{Curved surface area of tube well} = 2 \times (22/7) \times 1.5 \times 280$$

So we get

$$\text{Curved surface area of tube well} = 2640 \text{ m}^2$$

It is given that

$$\text{So the cost of cementing} = ₹ (10 \times 2640) = ₹ 26400$$

Therefore, cost of sinking the tube well is ₹ 29700 and the cost of cementing is ₹ 26400.

**30. Find the length of 13.2 kg of copper wire of diameter 4mm, when 1 cubic centimeter of copper weighs**

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

**8.4kg.**

**Solution:**

Consider  $h$  m as the length of the wire

We know that

Volume of the wire  $\times 8.4$  g =  $(13.2 \times 1000)$  g

By substituting the values

$$(22/7) \times (2/10)^2 \times h \times 8.4 = 13200$$

On further calculation

$$22 \times (1/5)^2 \times h \times 8.4 = 13200$$

So we get

$$h = (13200 \times 5 \times 5) / (22 \times 1.2)$$

By simplification

$$h = 12500\text{cm} = 125\text{m}$$

Therefore, the length of wire is 125m.

**31. It costs ₹ 3300 to paint the inner curved surface of a cylindrical vessel 10m deep at the rate of ₹ 30 per  $\text{m}^2$ . Find the**

**(i) inner curved surface area of the vessel,**

**(ii) inner radius of the base, and**

**(iii) capacity of the vessel.**

**Solution:**

(i) We know that

Cost of painting inner curved surface of the vessel = cost of painting per  $\text{m}^2 \times$  inner curved surface of vessel

By substituting the values

$$3300 = 30 \times \text{Inner curved surface of vessel}$$

On further calculation

$$\text{Inner curved surface of vessel} = 110 \text{ m}^2$$

(ii) Consider  $r$  as the inner radius of the base

It is given that depth = 10m

We know that

$$\text{Inner curved surface of vessel} = 2 \pi r h$$

By substituting the values

$$110 = 2 \times (22/7) \times r \times 10$$

So we get

$$r = (110 \times 7) / (2 \times 22 \times 10)$$

$$r = 1.75\text{m}$$

(iii) We know that

$$\text{Capacity of the vessel} = \pi r^2 h$$

By substituting the values

$$\text{Capacity of the vessel} = (22/7) \times (1.75)^2 \times 10$$

So we get

$$\text{Capacity of the vessel} = 96.25 \text{ m}^3$$

**32. The difference between inside and outside surfaces of a cylindrical tube 14cm long, is  $88\text{cm}^2$ . If the volume of the tube is  $176 \text{ cm}^3$ , find the inner and outer radii of the tube.**

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids****Solution:**

Consider  $R$  cm as the outer radius and  $r$  cm as the inner radius of the cylindrical tube  
It is given that length = 14 cm

We know that

Outside surface area – Inner surface area = 88

So we get

$$2\pi Rh - 2\pi rh = 88$$

It can be written as

$$2\pi(R-r)h = 88$$

By substituting the values

$$2 \times (22/7) \times (R-r) \times 14 = 88$$

On further calculation

$$2 \times 22 \times (R-r) \times 2 = 88$$

We get

$$R-r = 88 / (2 \times 22 \times 2) = 1 \dots\dots\dots (1)$$

We know that

Volume of tube =  $176 \text{ cm}^3$

It can be written as

External volume – Internal volume = 176

So we get

$$\pi R^2 h - \pi r^2 h = 176$$

By taking common out

$$\pi(R^2 - r^2)h = 176$$

By substituting the values

$$(22/7) \times (R-r)(R+r) \times 14 = 176$$

Substituting equation (1)

$$22 \times 1 \times (R+r) \times 2 = 176$$

We get

$$R+r = 176 / (22 \times 2) = 4 \dots\dots\dots (2)$$

By adding both the equations

$$2R = 5$$

So we get  $R = 2.5 \text{ cm}$

By substituting  $r$

$$2.5 - r = 1$$

So we get  $r = 1.5 \text{ cm}$

Therefore, the inner and outer radii of the tube are 1.5cm and 2.5cm.

**33. A rectangular sheet of paper  $30\text{cm} \times 18\text{cm}$  can be transformed into the curved surface of a right circular cylinder in two ways namely, either by rolling the paper along its length or by rolling it along its breadth. Find the ratio of the volumes of the two cylinders, thus formed.**

**Solution:**

We know that

If the sheet is folded along its length it forms a cylinder of height  $h_1 = 18\text{cm}$  and perimeter = 30cm

Consider  $r_1$  as the radius and  $V_1$  as the volume

So we get

$$2\pi r_1 = 30$$

It can be written as

$$r_1 = 30/2\pi = 15/\pi$$

We know that

$$V_1 = \pi r_1^2 h_1$$

By substituting the values

$$V_1 = \pi \times (15/\pi)^2 \times 18$$

We get

$$V_1 = (225/\pi) \times 18 \text{ cm}^3$$

We know that

If the sheet is folded along its breadth it forms a cylinder of height  $h_2 = 30\text{cm}$  and perimeter  $18\text{cm}$

Consider  $r_2$  as the radius and  $V_2$  as the volume

So we get

$$2\pi r_2 = 18$$

It can be written as

$$r_2 = 18/2\pi = 9/\pi$$

We know that

$$V_2 = \pi r_2^2 h_2$$

By substituting the values

$$V_2 = \pi \times (9/\pi)^2 \times 30$$

We get

$$V_2 = (81/\pi) \times 30 \text{ cm}^3$$

So we get

$$V_1/V_2 = \{(225/\pi) \times 18\} / \{(81/\pi) \times 30\}$$

On further calculation

$$V_1/V_2 = (225 \times 18) / (81 \times 30)$$

We get

$$V_1/V_2 = 5/3$$

We can write it as

$$V_1:V_2 = 5:3$$

Therefore, the ratio of the volumes of the two cylinders thus formed is 5:3.

RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**EXERCISE 15(C)**

PAGE: 588

**1. Find the curved surface area of a cone with base radius 5.25cm and slant height 10cm.****Solution:**

It is given that

Radius of the cone = 5.25cm

Slant height of the cone = 10cm

We know that

Curved surface area of the cone =  $\pi rl$ 

By substituting the values

Curved surface area of the cone =  $(22/7) \times 5.25 \times 10$ 

So we get

Curved surface area of the cone =  $165 \text{ cm}^2$ Therefore, the curved surface area of a cone is  $165 \text{ cm}^2$ .**2. Find the total surface area of a cone, if its slant height is 21m and diameter of its base is 24m.****Solution:**

It is given that

Diameter of the cone = 24m

Radius of the cone =  $24/2 = 12\text{m}$ 

Slant height of the cone = 21m

We know that

Total surface area of a cone =  $\pi r (l + r)$ 

By substituting the values

Total surface area of a cone =  $(22/7) \times 12 (21+12)$ 

On further calculation

Total surface area of a cone =  $(22/7) \times 12 \times 33$ 

So we get

Total surface area of a cone =  $1244.57 \text{ m}^2$ Therefore, the total surface area of a cone is  $1244.57 \text{ m}^2$ .**3. A joker's cap is in the form of a right circular cone of base radius 7cm and height 24cm. Find the area of the sheet required to make 10 such caps.****Solution:**

It is given that

Radius of the cap = 7cm

Height of the cap = 24cm

We know that

Slant height of the cap

 $l = \sqrt{r^2 + h^2}$ 

By substituting the values

 $l = \sqrt{7^2 + 24^2}$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

On further calculation

$$l = \sqrt{49 + 576} = \sqrt{625}$$

So we get

$$l = 25\text{cm}$$

We know that

$$\text{Curved surface area of one cap} = \pi rl$$

By substituting the values

$$\text{Curved surface area of one cap} = (22/7) \times 7 \times 25$$

So we get

$$\text{Curved surface area of one cap} = 550 \text{ cm}^2$$

$$\text{So the curved surface area of 10 conical caps} = 10 \times 550 = 5500 \text{ cm}^2$$

Therefore, the area of the sheet required to make 10 such caps is  $5500 \text{ cm}^2$ .

**4. The curved surface area of a cone is  $308\text{cm}^2$  and its slant height is  $14\text{cm}$ . Find the radius of the base and total surface area of the cone.**

**Solution:**

Consider  $r$  as the radius of the cone

It is given that

$$\text{Slant height of the cone} = 14\text{cm}$$

$$\text{Curved surface area of the cone} = 308\text{cm}^2$$

It can be written as

$$\pi rl = 308$$

By substituting the values

$$(22/7) \times r \times 14 = 308$$

On further calculation

$$22 \times r \times 2 = 308$$

So we get

$$r = 308 / (22 \times 2)$$

$$r = 7\text{cm}$$

We know that

$$\text{Total surface area of a cone} = \pi r (l + r)$$

By substituting the values

$$\text{Total surface area of a cone} = (22/7) \times 7 \times (14 + 7)$$

On further calculation

$$\text{Total surface area of a cone} = 22 \times 21 = 462 \text{ cm}^2$$

Therefore, the base radius of the cone is  $7\text{cm}$  and the total surface area is  $462 \text{ cm}^2$ .

**5. The slant height and base diameter of a conical tomb are  $25\text{m}$  and  $14\text{m}$  respectively. Find the cost of whitewashing its curved surface at the rate of ₹ 12 per  $\text{m}^2$ .**

**Solution:**

It is given that

$$\text{Radius of the cone} = 7\text{m}$$

$$\text{Slant height of the cone} = 25\text{m}$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

We know that

Curved surface area of the cone =  $\pi rl$

By substituting the values

Curved surface area of the cone =  $(22/7) \times 7 \times 25$

So we get

Curved surface area of the cone =  $550 \text{ m}^2$

It is given that the cost of whitewashing = ₹ 12 per  $\text{m}^2$

So the cost of whitewashing  $550 \text{ m}^2$  area = ₹  $12 \times 550$  = ₹ 6600

Therefore, the cost of whitewashing its curved surface area is ₹ 6600.

**6. A conical tent is 10m high and the radius of its base is 24m. Find the slant height of the tent. If the cost of  $1\text{m}^2$  canvas is ₹ 70, find the cost of canvas required to make the tent.**

**Solution:**

It is given that

Radius of the conical tent = 24m

Height of conical tent = 10m

We know that

Slant height of conical tent can be written as

$$l = \sqrt{r^2 + h^2}$$

By substituting the values

$$l = \sqrt{24^2 + 10^2}$$

On further calculation

$$l = \sqrt{576 + 100} = \sqrt{676}$$

So we get

$$l = 26\text{m}$$

We know that

Curved surface area of conical tent =  $\pi rl$

By substituting the values

Curved surface area of conical tent =  $(22/7) \times 24 \times 26$

So we get

Curved surface area of conical tent =  $(13728/7) \text{ m}^2$

It is given that the cost of  $1\text{m}^2$  canvas = ₹ 70

So the cost of  $(13728/7) \text{ m}^2$  canvas = ₹  $70 \times (13728/7)$  = ₹ 137280

Therefore, the slant height of the tent is 26m and the cost of canvas required to make the tent is ₹ 137280.

**7. A bus stop is barricaded from the remaining part of the road by using 50 hollow cones made of recycled cardboard. Each one has a base diameter of 40cm and height 1m. If the outer side of each of the cones is to be painted and the cost of painting is ₹ 25 per  $\text{m}^2$ , what will be the cost of painting all these cones? (Use  $\pi = 3.14$  and  $\sqrt{1.04} = 1.02$ .)**

**Solution:**

It is given that

Radius of the cone = 20cm = 0.2m

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Height of the cone = 1m

We know that

$$\text{Slant height } l = \sqrt{r^2 + h^2}$$

By substituting the values

$$l = \sqrt{(0.2^2 + 1^2)}$$

On further calculation

$$l = \sqrt{(0.04 + 1)} = \sqrt{1.04}$$

So we get

$$l = 1.02\text{m}$$

We know that

$$\text{Curved surface area of cone} = \pi rl$$

By substituting the values

$$\text{Curved surface area of cone} = 3.14 \times 0.2 \times 1.02$$

On further calculation

$$\text{Curved surface area of cone} = 0.64056 \text{ m}^2$$

$$\text{So the curved surface area of 50 cones} = 50 \times 0.64056 = 32.028 \text{ m}^2$$

It is given that

$$\text{Cost of painting} = ₹ 25 \text{ per m}^2$$

$$\text{So the cost of painting } 32.028 \text{ m}^2 \text{ area} = ₹ 25 \times 32.028 = ₹ 800.70$$

Therefore, the cost of painting all these cones is ₹ 800.70.

**8. Find the volume, curved surface area and the total surface area of a cone having base radius 35cm and height 12cm.**

**Solution:**

It is given that

$$\text{Radius of the cone} = 35\text{cm}$$

$$\text{Height of the cone} = 12\text{cm}$$

We know that

$$\text{Volume of the cone} = \frac{1}{3} \pi r^2 h$$

By substituting the values

$$\text{Volume of the cone} = \frac{1}{3} \times \left(\frac{22}{7}\right) \times 35^2 \times 12$$

On further calculation

$$\text{Volume of the cone} = 15400 \text{ cm}^3$$

We know that

$$\text{Slant height } l = \sqrt{r^2 + h^2}$$

By substituting the values

$$l = \sqrt{(35^2 + 12^2)}$$

On further calculation

$$l = \sqrt{1369}$$

So we get

$$l = 37 \text{ cm}$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

We know that

Curved surface area of a cone =  $\pi rl$

By substituting the values

Curved surface area of a cone =  $(22/7) \times 35 \times 37$

So we get

Curved surface area of a cone =  $4070 \text{ cm}^2$

We know that

Total surface area of cone =  $\pi r (l + r)$

By substituting the values

Total surface area of cone =  $(22/7) \times 35 \times (37 + 35)$

On further calculation

Total surface area of cone =  $22 \times 5 \times 72$

So we get

Total surface area of cone =  $7920 \text{ cm}^2$

**9. Find the volume, curved surface area and the total surface area of a cone whose height is 6cm and slant height 10cm. (Take  $\pi = 3.14$ .)**

**Solution:**

It is given that

Height of the cone = 6cm

Slant height of the cone  $b = 10\text{cm}$

We know that

Radius of the cone =  $\sqrt{l^2 - h^2}$

By substituting the values

Radius of the cone =  $\sqrt{10^2 - 6^2}$

On further calculation

Radius of the cone =  $\sqrt{100 - 36} = \sqrt{64}$

So we get

Radius of the cone = 8cm

We know that

Volume of the cone =  $\frac{1}{3} \pi r^2 h$

By substituting the values

Volume of the cone =  $\frac{1}{3} \times 3.14 \times 8^2 \times 6$

On further calculation

Volume of the cone =  $401.92 \text{ cm}^3$

We know that

Curved surface area of a cone =  $\pi rl$

By substituting the values

Curved surface area of a cone =  $3.14 \times 8 \times 10$

So we get

Curved surface area of a cone =  $251.2 \text{ cm}^2$

We know that

Total surface area of cone =  $\pi r (l + r)$

By substituting the values

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Total surface area of cone =  $3.14 \times 8 \times (10 + 8)$

On further calculation

Total surface area of cone =  $3.14 \times 8 \times 18$

So we get

Total surface area of cone =  $452.16 \text{ cm}^2$

**10. A conical pit of diameter 3.5m is 12m deep. What is its capacity in kilolitres?**

**Solution:**

It is given that

Diameter of the conical pit = 3.5m

Radius of the conical pit =  $3.5/2 = 1.75\text{m}$

Depth of the conical pit = 12m

We know that

Volume of the conical pit =  $\frac{1}{3} \pi r^2 h$

By substituting the values

Volume of the conical pit =  $\frac{1}{3} \times (22/7) \times 1.75^2 \times 12$

On further calculation

Volume of the conical pit =  $38.5 \text{ m}^3 = 38.5 \text{ kilolitres}$

Therefore, the capacity of the conical pit is 38.5 kilolitres.

**11. A heap of wheat is in the form of a cone of diameter 9m and height 3.5m. Find its volume. How much canvas cloth is required to just cover the heap? (Use  $\pi = 3.14$ .)**

**Solution:**

It is given that

Diameter of the conical heap = 9m

Radius of the conical heap =  $9/2 = 4.5\text{m}$

Height of the conical heap = 3.5m

We know that

Volume of the conical heap =  $\frac{1}{3} \pi r^2 h$

By substituting the values

Volume of the conical heap =  $\frac{1}{3} \times 3.14 \times 4.5^2 \times 3.5$

On further calculation

Volume of the conical heap =  $3.14 \times 1.5 \times 4.5 \times 3.5$

So we get

Volume of the conical heap =  $74.1825 \text{ m}^3$

We know that

Slant height  $l = \sqrt{r^2 + h^2}$

By substituting the values

$l = \sqrt{4.5^2 + 3.5^2}$

On further calculation

$l = \sqrt{32.5}$

So we get

$l = 5.7 \text{ m}$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

We know that

Curved surface area of the conical heap =  $\pi rl$

By substituting the values

Curved surface area of the conical heap =  $3.14 \times 4.5 \times 5.7$

On further calculation

Curved surface area of the conical heap =  $80.54 \text{ m}^2$

Therefore,  $80.54 \text{ m}^2$  of canvas is required to cover the heap of wheat.

**12. A man uses a piece of canvas having an area of  $551 \text{ m}^2$ , to make a conical tent of base radius 7m. Assuming that all the stitching margins and wastage incurred while cutting, amount to approximately  $1 \text{ m}^2$ , find the volume of the tent that can be made with it.**

**Solution:**

It is given that

Radius of the conical tent = 7m

So the area of canvas required to make the conical tent =  $551 - 1 = 550 \text{ m}^2$

We know that

Curved surface area of a conical tent = 550

So we get

$\pi rl = 550$

By substituting the values

$(22/7) \times 7 \times l = 550$

On further calculation

$l = 550/22 = 25 \text{ m}$

We know that

Height  $h = \sqrt{(l^2 - r^2)}$

By substituting the values

$h = \sqrt{(25^2 - 7^2)}$

On further calculation

$h = \sqrt{(625 - 49)} = \sqrt{576}$

So we get

$h = 24 \text{ m}$

We know that

Volume of the conical tent =  $1/3 \pi r^2 h$

By substituting the values

Volume of the conical tent =  $1/3 \times (22/7) \times 7^2 \times 24$

On further calculation

Volume of the conical tent =  $1232 \text{ m}^3$

Therefore, the volume of the conical tent is  $1232 \text{ m}^3$ .

**13. How many metres of cloth, 2.5m wide, will be required to make a conical tent whose base radius is 7m and height 24m?**

**Solution:**

It is given that

## RS Aggarwal Solutions for Class 9 Maths Chapter 15 – Volume and Surface Area of Solids

Radius of the conical tent = 7m  
Height of the conical tent = 24m

We know that  
Slant height  $l = \sqrt{(r^2 + h^2)}$   
By substituting the values  
 $l = \sqrt{(7^2 + 24^2)}$   
On further calculation  
 $l = \sqrt{(49 + 576)} = \sqrt{625}$   
So we get  
 $l = 25 \text{ m}$

We know that  
Area of the cloth =  $\pi rl$   
By substituting the values  
Area of the cloth =  $(22/7) \times 7 \times 25$   
On further calculation  
Area of the cloth =  $550 \text{ m}^2$

We know that  
Length of the cloth = area/ width  
By substituting the values  
Length of the cloth =  $550 / 2.5 = 220\text{m}$

Therefore, 220m of cloth is required to make the conical tent.

**14. Two cones have their heights in the ratio 1:3 and the radii of their bases in the ratio 3:1. Show that their volumes are in the ratio 3:1.**

**Solution:**

Consider the heights as  $h$  and  $3h$  and radii as  $3r$  and  $r$   
So we get  
 $V_1 = 1/3 \pi (3r)^2 h$  and  $V_2 = 1/3 \pi r^2 \times 3h$   
By dividing both we get  
 $V_1 / V_2 = (1/3 \pi (3r)^2 h) / (1/3 \pi r^2 \times 3h)$   
On further calculation  
 $V_1 / V_2 = 3/1$   
It can be written as  
 $V_1 : V_2 = 3:1$

Therefore, it is proved that their volumes are in the ratio 3:1.

**15. A cylinder and a cone have equal radii of their bases and equal heights. If their curved surface areas are in the ratio 8:5, show that the radius and height of each has the ratio 3:4.**

**Solution:**

Consider the curved surface area of cylinder and cone as  $8x$  and  $5x$ .  
So we get  
 $2 \pi rh = 8x \dots\dots\dots (1)$   
 $\pi r \sqrt{(h^2 + r^2)} = 5x \dots\dots\dots (2)$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

By squaring equation (1)

$$(2 \pi r h)^2 = (8x)^2$$

So we get

$$4 \pi^2 r^2 h^2 = 64 x^2 \dots\dots\dots (3)$$

By squaring equation (2)

$$\pi^2 r^2 (h^2 + r^2) = 25x^2 \dots\dots\dots (4)$$

Dividing equation (3) by (4)

$$4 \pi^2 r^2 h^2 / \pi^2 r^2 (h^2 + r^2) = 64 x^2 / 25x^2$$

On further calculation

$$h^2 / (h^2 + r^2) = 16/25$$

It can be written as

$$9 h^2 = 16 r^2$$

So we get

$$r^2 / h^2 = 9/16$$

By taking square root

$$r / h = 3/4$$

We get

$$r : h = 3 : 4$$

Therefore, it is proved that the radius and height of each has the ratio 3:4.

**16. A right circular cone is 3.6cm high and radius of its base is 1.6cm. It is melted and recast into a right circular cone having base radius 1.2cm. Find its height.**

**Solution:**

It is given that

Height of the cone = 3.6cm

Radius of the cone = 1.6cm

Radius after melting = 1.2cm

We know that

Volume of original cone = Volume of cone after melting

By substituting the values

$$1/3 \pi \times 1.6^2 \times 3.6 = 1/3 \pi \times 1.2^2 \times h$$

It can be written as

$$h = (1/3 \pi \times 1.6^2 \times 3.6) / (1/3 \pi \times 1.2^2)$$

On further calculation

$$h = 6.4\text{cm}$$

Therefore, the height of the right circular cone is 6.4cm.

**17. A circus tent is cylindrical to a height of 3 metres and conical above it. If its diameter is 15m and the slant height of the conical portion is 53m, calculate the length of the canvas 5m wide to make the required tent.**

**Solution:**

It is given that

Diameter of the cylinder = 105m

## RS Aggarwal Solutions for Class 9 Maths Chapter 15 – Volume and Surface Area of Solids

Radius of the cylinder =  $105/2 = 52.5\text{m}$

Height of the cylinder =  $3\text{m}$

Slant height of the cylinder =  $53\text{m}$

We know that

Area of canvas =  $2 \pi RH + \pi Rl$

By substituting the values

Area of canvas =  $(2 \times (22/7) \times 52.5 \times 3) + ((22/7) \times 52.5 \times 53)$

On further calculation

Area of canvas =  $990 + 8745 = 9735\text{m}^2$

We know that

Length of canvas =  $\text{area} / \text{width} = 9735/5 = 1947\text{m}$

Therefore, the length of canvas required to make the tent is  $1947\text{m}$ .

**18. An iron pillar consists of a cylindrical portion  $2.8\text{m}$  high and  $20\text{cm}$  in diameter and a cone  $42\text{cm}$  high is surmounting it. Find the weight of the pillar, given that  $1\text{cm}^3$  of iron weighs  $7.5\text{g}$ .**

**Solution:**

It is given that

Height of the cylinder =  $2.8\text{m} = 280\text{cm}$

Diameter of the cylinder =  $20\text{cm}$

Radius of the cylinder =  $20/2 = 10\text{cm}$

Height of the cone =  $42\text{cm}$

We know that

Volume of the pillar =  $\pi r^2 h + 1/3 \pi r^2 H$

It can be written as

Volume of the pillar =  $\pi r^2 (h + 1/3 H)$

By substituting the values

Volume of the pillar =  $(22/7) \times 10^2 (280 + (1/3 \times 42))$

On further calculation

Volume of the pillar =  $2200/7 \times (280 + 14) = 92400 \text{ cm}^3$

So the weight of pillar =  $(92400 \times 7.5) / 1000 = 693\text{kg}$

Therefore, the weight of the pillar is  $693\text{kg}$ .

**19. From a solid right circular cylinder with height  $10\text{cm}$  and radius of the base  $6\text{cm}$ , a right circular cone of the same height and base is removed. Find the volume of the remaining solid. (Take  $\pi = 3.14$ .)**

**Solution:**

It is given that

Height of the cylinder =  $10\text{cm}$

Radius of the cylinder =  $6\text{cm}$

We know that

Volume of the remaining solid =  $\pi r^2 h - 1/3 \pi r^2 h$

By substituting the values

## RS Aggarwal Solutions for Class 9 Maths Chapter 15 – Volume and Surface Area of Solids

Volume of the remaining solid =  $(\pi \times 6^2 \times 10) - (1/3 \pi \times 6^2 \times 10)$

It can be written as

Volume of the remaining solid =  $2/3 \pi \times 6^2 \times 10$

So we get

Volume of the remaining solid =  $2/3 \times 3.14 \times 360 = 753.6 \text{ cm}^3$

Therefore, the volume of the remaining solid is  $753.6 \text{ cm}^3$ .

**20. Water flows at the rate of 10 metres per minute through a cylindrical pipe 5mm in diameter. How long would it take to fill a conical vessel whose diameter at the surface is 40cm and depth 24cm?**

**Solution:**

It is given that

Diameter of the pipe = 5mm = 0.5cm

Radius of the pipe =  $0.5/2 = 0.25\text{cm}$

Length of the pipe = 10m = 1000cm

We know that

Volume of water that flows in 1 minute =  $\pi \times 0.25^2 \times 1000$

So the volume of conical flask =  $1/3 \pi \times 20^2 \times 24$

The time required to fill the conical vessel = volume of the conical vessel / volume that flows in 1 minute

By substituting the values

Required time =  $(1/3 \pi \times 20^2 \times 24) / (\pi \times 0.25^2 \times 1000)$

On further calculation

Required time =  $(1/3 \pi \times 400 \times 24) / (\pi \times 0.0625 \times 1000)$

So we get

Required time = 51.12 minutes = 51 minutes 12 seconds

Therefore, the time required to fill the conical vessel is 51 minutes 12 seconds.

**21. A cloth having an area of  $165 \text{ m}^2$  is shaped into the form of a conical tent of radius 5m.**

**(i) How many students can sit in the tent if a student, on an average, occupies  $5/7 \text{ m}^2$  on the ground?**

**(ii) Find the volume of the cone.**

**Solution:**

(i) We know that

Area of the floor of the tent =  $\pi r^2$

By substituting the values

Area of the floor of the tent =  $(22/7) \times 5^2 = 550/7 \text{ m}^2$

We know that the area required by one student is  $5/7 \text{ m}^2$

So the required number of students =  $(550/7) / (5/7) = 110$

(ii) We know that

Curved surface area of the tent = area of the cloth =  $165 \text{ m}^2$

So we get

$\pi r l = 165$

By substituting the values

$(22/7) \times 5 \times l = 165$

On further calculation

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

$$l = (165 \times 7) / (22 \times 5) = 21/2 \text{ m}$$

We know that

$$h = \sqrt{(l^2 - r^2)}$$

By substituting the values

$$h = \sqrt{((21/2)^2 - 5^2)}$$

On further calculation

$$h = \sqrt{((441/4) - 25)} = \sqrt{(341/4)}$$

So we get

$$h = 9.23 \text{ m}$$

We know that

$$\text{Volume of the tent} = 1/3 \pi r^2 h$$

By substituting the values

$$\text{Volume of the tent} = 1/3 \times (22/7) \times 5^2 \times 9.23$$

On further calculation

$$\text{Volume of the tent} = 241.7 \text{ m}^3$$

RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of SolidsEXERCISE 15(D)

PAGE: 600

**1. Find the volume and surface area of a sphere whose radius is:****(i) 3.5 cm****(ii) 4.2 cm****(iii) 5m****Solution:****(i)** It is given that

Radius of the sphere = 3.5cm

We know that

Volume of the sphere =  $\frac{4}{3} \pi r^3$ 

By substituting the values

Volume of the sphere =  $\frac{4}{3} \times \left(\frac{22}{7}\right) \times 3.5^3$ 

So we get

Volume of the sphere = 179.67 cm<sup>3</sup>

We know that

Surface area of the sphere =  $4 \pi r^2$ 

By substituting the values

Surface area of the sphere =  $4 \times \left(\frac{22}{7}\right) \times 3.5^2$ 

So we get

Surface area of the sphere = 154 cm<sup>2</sup>**(ii)** It is given that

Radius of the sphere = 4.2cm

We know that

Volume of the sphere =  $\frac{4}{3} \pi r^3$ 

By substituting the values

Volume of the sphere =  $\frac{4}{3} \times \left(\frac{22}{7}\right) \times 4.2^3$ 

So we get

Volume of the sphere = 310.464 cm<sup>3</sup>

We know that

Surface area of the sphere =  $4 \pi r^2$ 

By substituting the values

Surface area of the sphere =  $4 \times \left(\frac{22}{7}\right) \times 4.2^2$ 

So we get

Surface area of the sphere = 221.76 cm<sup>2</sup>**(iii)** It is given that

Radius of the sphere = 5cm

We know that

Volume of the sphere =  $\frac{4}{3} \pi r^3$ 

By substituting the values

Volume of the sphere =  $\frac{4}{3} \times \left(\frac{22}{7}\right) \times 5^3$ 

So we get

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Volume of the sphere =  $523.81 \text{ m}^3$

We know that

Surface area of the sphere =  $4\pi r^2$

By substituting the values

Surface area of the sphere =  $4 \times (22/7) \times 5^2$

So we get

Surface area of the sphere =  $314.28 \text{ m}^2$

**2. The volume of a sphere is  $38808 \text{ cm}^3$ . Find its radius and hence its surface area.**

**Solution:**

We know that

Volume of the sphere =  $\frac{4}{3}\pi r^3$

By substituting the values

$38808 = \frac{4}{3} \times (22/7) \times r^3$

On further calculation

$r^3 = (38808 \times 3 \times 7) / 88$

So we get

$r^3 = 9261$

By taking cube root

$r = 21\text{cm}$

We know that

Surface area of the sphere =  $4\pi r^2$

By substituting the values

Surface area of the sphere =  $4 \times (22/7) \times 21^2$

So we get

Surface area of the sphere =  $5544 \text{ cm}^2$

Therefore, the radius of the sphere is 21cm and the surface area is  $5544 \text{ cm}^2$ .

**3. Find the surface area of a sphere whose volume is  $606.375\text{m}^3$ .**

**Solution:**

We know that

Volume of the sphere =  $\frac{4}{3}\pi r^3$

By substituting the values

$606.375 = \frac{4}{3} \times (22/7) \times r^3$

On further calculation

$r^3 = (606.375 \times 3 \times 7) / 88$

So we get

$r^3 = 144.703125$

By taking cube root

$r = 5.25\text{m}$

We know that

Surface area of the sphere =  $4\pi r^2$

By substituting the values

Surface area of the sphere =  $4 \times (22/7) \times 5.25^2$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

So we get

$$\text{Surface area of the sphere} = 346.5 \text{ m}^2$$

Therefore, the surface area of the sphere is  $346.5 \text{ m}^2$ .

**4. Find the volume of a sphere whose surface area is  $154 \text{ cm}^2$ .**

**Solution:**

We know that

$$\text{Surface area of the sphere} = 4 \pi r^2$$

By substituting the values

$$4 \pi r^2 = 154$$

On further calculation

$$4 \times (22/7) \times r^2 = 154$$

So we get

$$r^2 = (154 \times 7) / (4 \times 22) = 49/4$$

By taking the square root

$$r = 7/2 \text{ cm}$$

We know that

$$\text{Volume of the sphere} = 4/3 \pi r^3$$

By substituting the values

$$\text{Volume of the sphere} = 4/3 \times (22/7) \times (7/2)^3$$

So we get

$$\text{Volume of the sphere} = 179.67 \text{ cm}^3$$

Therefore, the volume of the sphere is  $179.67 \text{ cm}^3$ .

**5. The surface area of sphere is  $(576\pi) \text{ cm}^2$ . Find its volume.**

**Solution:**

We know that

$$\text{Surface area of the sphere} = 4 \pi r^2$$

By substituting the values

$$4 \pi r^2 = 576\pi$$

On further calculation

$$r^2 = 576 / 4 = 144$$

By taking square root

$$r = 12 \text{ cm}$$

We know that

$$\text{Volume of the sphere} = 4/3 \pi r^3$$

By substituting the values

$$\text{Volume of the sphere} = 4/3 \times \pi \times (12)^3$$

So we get

$$\text{Volume of the sphere} = 2304 \pi \text{ cm}^3$$

Therefore, the volume of the sphere is  $2304 \pi \text{ cm}^3$ .

**6. How many lead shots, each 3mm in diameter, can be made from a cuboid with dimensions  $(12 \text{ cm} \times 11 \text{ cm} \times 4 \text{ cm})$ ?**

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

× 9cm)?

**Solution:**

It is given that

Diameter = 3mm = 0.3cm

Radius =  $0.3/2$  cm

We know that

Number of lead shots = volume of cuboid/ volume of 1 lead shot

By substituting the values

Number of lead shots =  $(12 \times 11 \times 9) / (4/3 \times (22/7) \times (0.3/2)^3)$

On further calculation

Number of lead shots =  $(12 \times 11 \times 9) / (4/3 \times (22/7) \times (0.027/8))$

So we get

Number of lead shots = 84000

Therefore, the number of lead shots are 84000.

**7. How many lead balls, each of radius 1cm, can be made from a sphere of radius 8cm?**

**Solution:**

It is given that

Radius of lead ball = 1cm

Radius of sphere = 8cm

We know that

Number of lead balls = volume of sphere/ volume of one lead ball

So we get

Number of lead balls =  $(4/3 \pi R^3) / (4/3 \pi r^3)$

By substituting the values

Number of lead balls =  $(4/3 \times (22/7) \times 8^3) / (4/3 \times (22/7) \times 1^3)$

On further calculation

Number of lead balls =  $(4/3 \times (22/7) \times 512) / (4/3 \times (22/7) \times 1)$

We get

Number of lead balls = 512

Therefore, 512 lead balls can be made from the sphere.

**8. A solid sphere of radius 3cm is melted and then cast into smaller spherical balls, each of diameter 6cm.**

**Find the number of small balls thus obtained.**

**Solution:**

It is given that

Radius of sphere = 3cm

Diameter of spherical ball = 0.6cm

Radius of spherical ball =  $0.6/2 = 0.3$ cm

We know that

Number of balls = Volume of sphere/ Volume of one small ball

So we get

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Number of balls =  $(4/3 \times (22/7) \times 3^3) / (4/3 \times (22/7) \times 0.3^3)$   
On further calculation  
Number of balls =  $(4/3 \times (22/7) \times 27) / (4/3 \times (22/7) \times 0.027)$   
We get  
Number of balls = 1000

Therefore, 1000 balls are obtained from the solid sphere.

**9. A metallic sphere of radius 10.5cm is melted and then recast into smaller cones, each of radius 3.5cm and height 3cm. How many cones are obtained?**

**Solution:**

It is given that  
Radius of the sphere = 10.5cm  
Radius of smaller cone = 3.5cm  
Height = 3cm

We know that  
Number of cones = Volume of the sphere / Volume of one small cone  
So we get  
Number of cones =  $(4/3 \times (22/7) \times 10.5^3) / (1/3 \times (22/7) \times 3.5^2 \times 3)$   
On further calculation  
Number of cones =  $4851 / 38.5 = 126$

Therefore, 126 cones are obtained from the metallic sphere.

**10. How many spheres 12cm in diameter can be made from a metallic cylinder of diameter 8cm and height 90cm?**

**Solution:**

It is given that  
Diameter of the sphere = 12cm  
Radius of the sphere =  $12/2 = 6$ cm

We know that  
Volume of the sphere =  $4/3 \pi r^3$   
By substituting the values  
Volume of the sphere =  $4/3 \times (22/7) \times 6^3$   
So we get  
Volume of the sphere = 905.142 cm<sup>3</sup>

It is given that  
Diameter of the cylinder = 8cm  
Radius of the cylinder =  $8/2 = 4$ cm  
Height of the cylinder = 90cm

We know that  
Volume of the cylinder =  $\pi r^2 h$   
By substituting the values  
Volume of the cylinder =  $(22/7) \times 4^2 \times 90$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

So we get

$$\text{Volume of the cylinder} = 4525.714 \text{ cm}^3$$

We know that

$$\text{Number of spheres} = \text{Volume of cylinder} / \text{Volume of sphere}$$

By substituting the values

$$\text{Number of spheres} = 4525.714 / 905.142 = 5$$

Therefore, 5 spheres can be made from a metallic cylinder.

**11. The diameter of a sphere is 6cm. It is melted and drawn into a wire of diameter 2mm. Find the length of the wire.**

**Solution:**

It is given that

$$\text{Diameter of the sphere} = 6\text{cm}$$

$$\text{Radius of the sphere} = 6/2 = 3\text{cm}$$

$$\text{Diameter of the wire} = 2\text{mm} = 0.2 \text{ cm}$$

$$\text{Radius of the wire} = 2/2 = 1\text{mm} = 0.1 \text{ cm}$$

Consider  $h$  cm as the required length

So we get

$$\pi r^2 h = \frac{4}{3} \pi R^3$$

By substituting the values

$$(22/7) \times 0.1^2 \times h = \frac{4}{3} \times (22/7) \times 3^3$$

On further calculation

$$h = (\frac{4}{3} \times (22/7) \times 27) / ((22/7) \times 0.1^2)$$

So we get

$$h = 36/0.01 = 3600\text{cm} = 36\text{m}$$

Therefore, the length of the wire is 36m.

**12. The diameter of a copper sphere is 18cm. It is melted and drawn into a long wire of uniform cross section. If the length of the wire is 108m, find its diameter.**

**Solution:**

It is given that

$$\text{Diameter of the sphere} = 18\text{cm}$$

$$\text{Radius of the sphere} = 18/2 = 9\text{cm}$$

$$\text{Length of the wire} = 108\text{m} = 10800 \text{ cm}$$

We know that

$$\pi r^2 h = \frac{4}{3} \pi R^3$$

By substituting the values

$$(22/7) \times r^2 \times 10800 = \frac{4}{3} \times (22/7) \times 9^3$$

On further calculation

$$r^2 = (\frac{4}{3} \times (22/7) \times 729) / ((22/7) \times 10800)$$

So we get

$$r^2 = (4 \times 243) / 10800 = 9/100$$

By taking square root on the RHS

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

$$r = 3/10 = 0.3 \text{ cm}$$
$$\text{Diameter} = 2 (0.3) = 0.6 \text{ cm}$$

Therefore, the diameter of the wire is 0.6cm.

**13. A sphere of diameter 15.6cm is melted and cast into a right circular cone of height 31.2cm. Find the diameter of the base of the cone.**

**Solution:**

It is given that

Diameter of the sphere = 15.6 cm

Radius of the sphere =  $15.6/2 = 7.8 \text{ cm}$

Height of the cone = 31.2 cm

We know that

$$\frac{4}{3} \pi R^3 = \frac{1}{3} \pi r^2 h$$

So we get

$$\frac{4}{3} \times \frac{22}{7} \times 7.8^3 = \frac{1}{3} \times \frac{22}{7} \times r^2 \times 31.2$$

On further calculation

$$r^2 = (\frac{4}{3} \times \frac{22}{7} \times 7.8^3) / (\frac{1}{3} \times \frac{22}{7} \times 31.2)$$

So we get

$$r^2 = (4 \times 474.552) / 31.2 = 60.84$$

By taking square root on the RHS

$$r = 7.8 \text{ cm}$$

$$\text{Diameter} = 2 (7.8) = 15.6 \text{ cm}$$

Therefore, the diameter of the base of the cone is 15.6cm.

**14. A spherical cannonball 28cm in diameter is melted and cast into a right circular cone mould, whose base is 35cm in diameter. Find the height of the cone.**

**Solution:**

It is given that

Diameter of the sphere = 28cm

Radius of the sphere =  $28/2 = 14 \text{ cm}$

Diameter of the cone = 35cm

Radius of the cone =  $35/2 = 17.5 \text{ cm}$

We know that

$$\frac{4}{3} \pi R^3 = \frac{1}{3} \pi r^2 h$$

So we get

$$\frac{4}{3} \times \frac{22}{7} \times 14^3 = \frac{1}{3} \times \frac{22}{7} \times 17.5^2 \times h$$

On further calculation

$$h = (\frac{4}{3} \times \frac{22}{7} \times 14^3) / (\frac{1}{3} \times \frac{22}{7} \times 17.5^2)$$

We get

$$h = 10976 / 306.25$$

$$h = 35.84 \text{ cm}$$

Therefore, the height of the cone is 35.84cm.

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

**15. A spherical ball of radius 3cm is melted and recast into three spherical balls. The radii of two of these balls are 1.5cm and 2cm. Find the radius of the third ball.**

**Solution:**

Consider  $r$  cm as the radius of the third ball

We know that

$$\frac{4}{3} \pi (3)^3 = \frac{4}{3} \pi (3/2)^3 + \frac{4}{3} \pi (2)^3 + \frac{4}{3} \pi r^3$$

It can be written as

$$\frac{4}{3} \pi (27) = \frac{4}{3} \pi (27/8) + \frac{4}{3} \pi (8) + \frac{4}{3} \pi r^3$$

Dividing the entire equation by  $\frac{4}{3} \pi$

$$27 = 27/8 + 8 + r^3$$

On further calculation

$$r^3 = 27 - (27/8 + 8)$$

By taking LCM

$$r^3 = 27 - ((27 + 64)/8)$$

So we get

$$r^3 = 27 - (91/8)$$

By taking LCM

$$r^3 = (216 - 91)/8 = 125/8$$

By taking cube root

$$r = 5/2 = 2.5 \text{ cm}$$

Therefore, the radius of the third ball is 2.5cm.

**16. The radii of two spheres are in the ratio 1:2. Find the ratio of their surface areas.**

**Solution:**

Consider  $x$  and  $2x$  as the radius of two spheres and  $S_1$  and  $S_2$  as the surface areas

It can be written as

$$S_1/S_2 = 4\pi x^2/4\pi (2x)^2$$

On further calculation

$$S_1/S_2 = x^2/4x^2$$

So we get

$$S_1/S_2 = 1/4$$

Therefore, the ratio of their surface areas is 1:4.

**17. The surface areas of two spheres are in the ratio 1:4. Find the ratio of their volumes.**

**Solution:**

Consider  $r$  and  $R$  as the radii of two spheres

We know that

$$4\pi r^2/4\pi R^2 = 1/4$$

So we get

$$(r/R)^2 = (1/2)^2$$

It can be written as

$$r/R = 1/2$$

Consider  $V_1$  and  $V_2$  as the volumes of the spheres

So we get

## RS Aggarwal Solutions for Class 9 Maths Chapter 15 – Volume and Surface Area of Solids

$$V_1/V_2 = (4/3 \pi r^3)/(4/3 \pi R^3)$$

We can write it as

$$(r/R)^3 = (1/2)^3 = 1/8$$

Therefore, the ratio of their volumes is 1: 8.

**18. A cylindrical tub of radius 12cm contains water to a depth of 20cm. A spherical iron ball is dropped into the tub and thus the level of water is raised by 6.75cm. What is the radius of the ball?**

**Solution:**

Consider  $r$  cm as the radius of ball and  $R$  cm as the radius of cylindrical tub

So we get

$$4/3 \pi r^3 = \pi R^2 h$$

By substituting the values

$$4/3 \times \pi \times r^3 = \pi \times 12^2 \times 6.75$$

On further calculation

$$r^3 = (\pi \times 12^2 \times 6.75) / 4/3 \times \pi$$

So we get

$$r^3 = 2916 / 4 = 729$$

By taking cube root

$$r = 9\text{cm}$$

Therefore, the radius of the ball is 9cm.

**19. A cylindrical bucket with base radius 15cm is filled with water up to a height of 20cm. A heavy iron spherical ball of radius 9cm is dropped into the bucket to submerge completely in the water. Find the increase in the level of water.**

**Solution:**

It is given that

Radius of the cylindrical bucket = 15cm

Height of the cylindrical bucket = 20cm

We know that

$$\text{Volume of water in bucket} = \pi r^2 h$$

By substituting the values

$$\text{Volume of water in bucket} = (22/7) \times 15^2 \times 20$$

So we get

$$\text{Volume of water in bucket} = 14142.8571 \text{ cm}^3$$

It is given that

Radius of spherical ball = 9cm

We know that

$$\text{Volume of spherical ball} = 4/3 \pi r^3$$

By substituting the values

$$\text{Volume of spherical ball} = 4/3 \times (22/7) \times 9^3$$

So we get

$$\text{Volume of spherical ball} = 3054.8571 \text{ cm}^3 \dots\dots (1)$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Consider  $h$  cm as the increase in water level

So we get

Volume of increased water level =  $\pi r^2 h$

By substituting the values

Volume of increased water level =  $(22/7) \times 15^2 \times h \dots\dots (2)$

By equating both the equations

$3054.8571 = (22/7) \times 15^2 \times h$

On further calculation

$h = 3054.8571 / ((22/7) \times 15^2) = 4.32$  cm

Therefore, the increase in the level of water is 4.32cm.

**20. The outer diameter of a spherical shell is 12cm and its inner diameter is 8cm. Find the volume of metal contained in the shell. Also, find its outer surface area.**

**Solution:**

It is given that

Outer diameter of spherical shell = 12cm

Radius of spherical shell =  $12/2 = 6$ cm

Inner diameter of spherical shell = 8cm

Radius of spherical shell =  $8/2 = 4$ cm

We know that

Volume of outer shell =  $\frac{4}{3} \pi r^3$

By substituting the values

Volume of outer shell =  $\frac{4}{3} \times (22/7) \times 6^3$

So we get

Volume of outer shell =  $905.15 \text{ cm}^3$

Volume of inner shell =  $\frac{4}{3} \pi r^3$

By substituting the values

Volume of inner shell =  $\frac{4}{3} \times (22/7) \times 4^3$

So we get

Volume of inner shell =  $268.20 \text{ cm}^3$

So the volume of metal contained in the shell = Volume of outer shell – Volume of inner shell

By substituting the values

Volume of metal contained in the shell =  $905.15 - 268.20 = 636.95 \text{ cm}^3$

We know that

Outer surface area =  $4\pi r^2$

By substituting the values

Outer surface area =  $4 \times (22/7) \times 6^2$

On further calculation

Outer surface area =  $452.57 \text{ cm}^2$

Therefore, the volume of metal contained in the shell is  $636.95 \text{ cm}^3$  and the outer surface area is  $452.57 \text{ cm}^2$ .

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

**21. A hollow spherical shell is made of a metal of density 4.5g per cm<sup>3</sup>. If its internal and external radii are 8cm and 9cm respectively, find the weight of the shell.**

**Solution:**

It is given that

Internal radius of the spherical shell = 8cm

External radius of the spherical shell = 9cm

Density of metal = 4.5g per cm<sup>3</sup>

We know that

Weight of shell =  $\frac{4}{3} \pi [R^3 - r^3] \times \text{Density}$

By substituting the values

Weight of shell =  $\frac{4}{3} \times \frac{22}{7} \times [9^3 - 8^3] \times (4.5/1000)$

On further calculation

Weight of shell =  $\frac{4}{3} \times \frac{22}{7} \times [729 - 512] \times (4.5/1000)$

So we get

Weight of shell =  $\frac{4}{3} \times \frac{22}{7} \times 217 \times (4.5/1000)$

We get

Weight of shell = 4.092kg

Therefore, the weight of the shell is 4.092kg.

**22. A hemisphere of lead of radius 9cm is cast into a right circular cone of height 72cm. Find the radius of the base of the cone.**

**Solution:**

It is given that

Radius of hemisphere = 9cm

Height of cone = 72cm

Consider r cm as the radius of the base of cone

We know that

$\frac{1}{3} \pi r^2 h = \frac{2}{3} \pi R^3$

By substituting the values

$\frac{1}{3} \times \pi \times r^2 \times 72 = \frac{2}{3} \times \pi \times 9^3$

On further calculation

$r^2 = (2/3 \times \pi \times 729) / (1/3 \times \pi \times 72)$

So we get

$r^2 = 20.25$

By taking square root

$r = 4.5$  cm

Therefore, the radius of the base of the cone is 4.5 cm.

**23. A hemispherical bowl of internal radius 9cm contains a liquid. This liquid is to be filled into cylindrical shaped small bottles of diameter 3cm and height 4cm. How many bottles are required to empty the bowl?**

**Solution:**

It is given that

Internal radius of the hemispherical bowl = 9cm

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

Diameter of the hemispherical bowl =  $9/2 = 4.5$  cm

Diameter of the bottle = 3cm

Radius of the bottle =  $3/2 = 1.5$ cm

Height of the bottle = 4cm

We know that

Number of bottles = Volume of bowl / Volume of each bottle

So we get

Number of bottles =  $(2/3 \pi R^3) / (\pi r^2 h)$

By substituting the values

Number of bottles =  $(2/3 \pi (9)^3) / (\pi (3/2)^2 h)$

On further calculation

Number of bottles =  $(2/3 (9)^3) / ((3/2)^2 h)$

So we get

Number of bottles = 54

Therefore, 54 bottles are required to empty the bowl.

**24. A hemispherical bowl is made of steel 0.5cm thick. The inside radius of the bowl is 4cm. Find the volume of steel used in making the bowl.**

**Solution:**

It is given that

Internal radius of the hemispherical bowl = 4cm

Thickness of the hemispherical bowl = 0.5cm

We know that

External radius =  $4 + 0.5 = 4.5$  cm

We know that

Volume of steel used in making the hemispherical bowl = volume of the shell

So we get

Volume of steel used in making the hemispherical bowl =  $2/3 \pi (4.5^3 - 4^3)$

On further calculation

Volume of steel used in making the hemispherical bowl =  $2/3 \times (22/7) \times [91.125 - 64]$

We get

Volume of steel used in making the hemispherical bowl =  $2/3 \times (22/7) \times 27.125 = 56.83 \text{ cm}^3$

Therefore, the volume of steel used in making the bowl is  $56.83 \text{ cm}^3$ .

**25. A hemispherical bowl is made of steel 0.25cm thick. The inner radius of the bowl is 5cm. Find the outer curved surface area of the bowl.**

**Solution:**

It is given that

Inner radius of the bowl = 5cm

Thickness of the bowl = 0.25cm

External radius =  $5 + 0.25 = 5.25$ cm

We know that

Outer curved surface area of the bowl =  $2 \pi r^2$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

By substituting the values

$$\text{Outer curved surface area of the bowl} = 2 \times (22/7) \times 5.25^2$$

On further calculation

$$\text{Outer curved surface area of the bowl} = 2 \times (22/7) \times 27.5625$$

So we get

$$\text{Outer curved surface area of the bowl} = 173.25 \text{ cm}^2$$

Therefore, the outer curved surface area of the bowl is  $173.25 \text{ cm}^2$ .

**26. A hemispherical bowl made of brass has inner diameter 10.5cm. Find the cost of tin-plating it on the inside at the rate of ₹ 32 per  $100\text{cm}^2$ .**

**Solution:**

It is given that

$$\text{Inner diameter of the hemispherical bowl} = 10.5\text{cm}$$

$$\text{Inner radius of the hemispherical bowl} = 10.5/2 = 5.25\text{cm}$$

We know that

$$\text{Inner curved surface area of the bowl} = 2 \pi r^2$$

By substituting the values

$$\text{Inner curved surface area of the bowl} = 2 \times (22/7) \times 5.25^2$$

On further calculation

$$\text{Inner curved surface area of the bowl} = 2 \times (22/7) \times 27.5625$$

So we get

$$\text{Inner curved surface area of the bowl} = 173.25 \text{ cm}^2$$

It is given that

$$\text{Cost of tin plating inside} = ₹ 32 \text{ per } 100\text{cm}^2$$

$$\text{So the cost of tin plating } 173.25 \text{ cm}^2 = ₹ (32 \times 173.25)/100 = ₹ 55.44$$

Therefore, the cost of tin plating it on the inside is ₹ 55.44.

**27. The diameter of the moon is approximately one fourth of the diameter of the earth. What fraction of the volume of the earth is the volume of the moon?**

**Solution:**

Consider  $d$  as the diameter of the earth

$$\text{So radius of the earth} = d/2$$

Consider  $d/4$  as the diameter of the moon

$$\text{So radius of the moon} = d/8$$

We know that

$$\text{Volume of moon} = \frac{4}{3} \pi (d/8)^3$$

On further calculation

$$\text{Volume of moon} = \frac{1}{512} \times \frac{4}{3} \pi d^3$$

We know that

$$\text{Volume of earth} = \frac{4}{3} \pi (d/2)^3$$

On further calculation

$$\text{Volume of earth} = \frac{1}{8} \times \frac{4}{3} \pi d^3$$

**RS Aggarwal Solutions for Class 9 Maths Chapter 15 –  
Volume and Surface Area of Solids**

So we get

$$\text{Volume of moon/ Volume of earth} = (1/512 \times 4/3 \pi d^3) / (1/8 \times 4/3 \pi d^3)$$

On further calculation

$$\text{Volume of moon/ Volume of earth} = 1/64$$

Therefore, the volume of moon is  $1/64$  of volume of earth.

**28. Volume and surface area of a solid hemisphere are numerically equal. What is the diameter of the hemisphere?**

**Solution:**

We know that

$$\text{Volume of solid hemisphere} = \text{Surface area of solid hemisphere}$$

So we get

$$2/3 \pi r^3 = 3 \pi r^2$$

It can be written as

$$r^3 / r^2 = (3 \times \pi \times 3) / (2 \times \pi)$$

We get

$$r = 9/2 \text{ units}$$

$$\text{So the diameter} = 2 (9/2) = 9 \text{ units}$$

Therefore, the diameter of the hemisphere is 9 units.
