

R S Aggarwal Solutions for Class 11 Maths Chapter 14 Measurement of Angles

Exercise 14

Page No: 516

Question 1: Using a protector, draw each of the following angles.

(i) 60° (ii) 130° (iii) 300° (iv) 430°

Solution:

(i)

Step 1: Draw a line AB.

Step 2: Place the baseline of the protractor along BA and make sure centre of the protractor lie at point B.

Step 3: Find 60° on the scale of the protractor and mark a small dot at the edge and named as P as shown below:

Step 4: Join P to B with a ruler to form the second arm, BP, of the angle.

Mark the angle with a small arc as shown below:

(ii) 130°

Step 1: Draw a line AB.

Step 2: Place the baseline of the protractor along BA and make sure centre of the protractor lie at point B.

Step 3: Find 130° on the scale of the protractor and mark a small dot at the edge and named as C as shown below:

R S Aggarwal Solutions for Class 11 Maths Chapter 14 Measurement of Angles

Step 4: Join C to B with a ruler to form the second arm, BC, of the angle.

Mark the angle with a small arc as shown below:

(iii) 300°

Step 1: Draw a line AB.

Step 2: Place the baseline of the protractor along BA and make sure centre of the protractor lie at point B.

Step 3: Find 300° on the scale of the protractor and mark a small dot at the edge and named as C as shown below:

R S Aggarwal Solutions for Class 11 Maths Chapter 14 Measurement of Angles

Step 4: Join C to B with a ruler to form the second arm, BC, of the angle.

Mark the angle with a small arc as shown below:

(iv) 430°

We know, adding or subtracting 360° from a particular angle does not change its position.
Therefore, given angle can also be written as:

$$430^\circ - 360^\circ = 70^\circ$$

Now, we have to draw an angle for 70°

R S Aggarwal Solutions for Class 11 Maths Chapter 14 Measurement of Angles

Step 1: Draw a line AB.

Step 2: Place the baseline of the protractor along BA and make sure centre of the protractor lie at point B.

Step 3: Find 430° on the scale of the protractor and mark a small dot at the edge and named as C as shown below:

Step 4: Join C to B with a ruler to form the second arm, BC, of the angle.

Mark the angle with a small arc as shown below:

Question 2: Express each of the following angles in radians.

(i) 36° (ii) 120° (iii) 225° (iv) 330°

(v) 400° (vi) $7^\circ 30'$ (vii) -270° (viii) $-(22^\circ 30')$

R S Aggarwal Solutions for Class 11 Maths Chapter 14 Measurement of Angles

Solution:

We know, Angle in radians = Angle in degrees $\times \pi/180^\circ$

(i) 36°

Angle in radians = $36^\circ \times \pi/180^\circ$

$$= \pi/5$$

(ii) 120°

Angle in radians = $120^\circ \times \pi/180^\circ$

$$= 2\pi/3$$

(iii) 225°

Angle in radians = $225^\circ \times \pi/180^\circ$

$$= 5\pi/4$$

(iv) 330°

Angle in radians = $330^\circ \times \pi/180^\circ$

$$= 11\pi/6$$

(v) 400°

Angle in radians = $400^\circ \times \pi/180^\circ$

$$= 20\pi/9$$

(vi) $7^\circ 30'$

Convert $30'$ into degrees = (angle in minutes)/60 = $(30/60)$ degrees = 0.5 degrees

Total angle = $(7 + 0.5)$ degrees = 7.5 degrees or 7.5°

Angle in radians = $7.5^\circ \times \pi/180^\circ$

$$= \pi/24$$

R S Aggarwal Solutions for Class 11 Maths Chapter 14 Measurement of Angles

(vii) -270°

Angle in radians = $-270^\circ \times \pi/180^\circ$

$$= -3\pi/2$$

(viii) $-(22^\circ 30')$

Convert $30'$ into degrees = (angle in minutes)/60 = $(30/60)$ degrees = 0.5 degrees

Total angle = $(22 + 0.5)$ degrees = 22.5 degrees or 22.5°

Angle in radians = $-22.5^\circ \times \pi/180^\circ$

$$= -\pi/8$$

Question 3: Express each of the following angles in degrees.

(i) $\left(\frac{5\pi}{12}\right)^c$

(ii) $-\left(\frac{18\pi}{5}\right)^c$

(iii) $\left(\frac{5}{6}\right)^c$

(iv) $(-4)^c$

Solution:

We know that.

$$\text{Angle in degrees} = \text{Angle in radians} \times \frac{180}{\pi}$$

(i) Angle in degrees = $5\pi/12 \times 180/\pi = 75$

(ii) Angle in degrees = $-18\pi/5 \times 180/\pi = -648$

(iii) Angle in degrees = $5/6 \times 180/\pi = 47.7272^\circ$

Write Angle in degrees, minutes and second:

R S Aggarwal Solutions for Class 11 Maths Chapter 14 Measurement of Angles

We know,

The angle in minutes = Decimal of angle in radian $\times 60'$

The angle in seconds = Decimal of angle in minutes $\times 60''$

Therefore, $0.7272^\circ = 0.7272 \times 60' = 43.632'$

Angle in seconds = $0.632 \times 60'' = 37.92''$ or $38''$

Final angle = $47^\circ 43' 38''$

(iv) Angle in degrees = $-4 \times 180/\pi = -229.0909^\circ$

Write Angle in minutes:

We know,

The angle in minutes = Decimal of angle in radian $\times 60'$

The angle in seconds = Decimal of angle in minutes $\times 60''$

Therefore, $0.0909^\circ = 0.0909 \times 60' = 5.4545'$

Angle in seconds = $0.4545 \times 60'' = 27.27''$

Final angle = $-(229^\circ 5' 27'')$

Question 4: The angles of a triangle are in AP, and the greatest angle is double the least. Find all the angles in degrees and radians.

Solution: Let $a - d$, a , $a + d$ be the three angles of the triangle that form AP.

Since greatest angle is double the least. (given)

So, $a + d = 2(a - d)$

or $a + d = 2a - 2d$

or $a = 3d$ (1)

Again, by angle sum property, we know

Sum of all the angles = 180 degrees

So, $(a - d) + a + (a + d) = 180^\circ$

or $3a = 180^\circ$

or $a = 60^\circ$ (2)

R S Aggarwal Solutions for Class 11 Maths Chapter 14 Measurement of Angles

From (1) and (2), we get

$$3d = 60^\circ$$
$$\text{or } d = 20^\circ$$

Now, the angles are,

$$a - d = 60^\circ - 20^\circ = 40^\circ$$

$$a = 60^\circ$$

$$a + d = 60^\circ + 20^\circ = 80^\circ.$$

Therefore the required angles are 40° , 60° and 80° .

Question 5: The difference between the two acute angles of a right triangle is $(\pi/5)^c$. Find these angles in radians and degrees.

Solution:

$$\text{Angle in degree} = \pi/5 \times 180/\pi = 36^\circ$$

Let x and y are two acute angles of a right triangle.

$$\text{So, } x - y = 36^\circ \quad \dots\dots(1)$$

Also we know,

$$x + y = 90^\circ \quad \dots\dots(2)$$

Solving (1) and (2), we get

$$2x = 126^\circ$$

$$\text{or } x = 63^\circ$$

$$\text{Form (2), } 63^\circ + y = 90^\circ$$

$$\text{or } y = 27^\circ$$

Therefore, two acute angles are 63° and 27° .

Represent angle into radian:

$$\text{We know, Angle in radians} = \text{Angle in degrees} \times \pi/180^\circ$$

$$\text{Angle in radians} = 63^\circ \times \pi/180^\circ$$

R S Aggarwal Solutions for Class 11 Maths Chapter 14 Measurement of Angles

$$= 7\pi/20$$

$$\text{And Angle in radians} = 27^\circ \times \pi/180^\circ$$

$$= 3\pi/20$$

Question 6: Find the radius of a circle in which a central angle of 45° intercepts an arc of length 33 cm. (Take $\pi = 22/7$)

Solution:

We know,

$$\text{Central angle } (\theta) = (\text{length arc})/\text{radius} \dots(1)$$

Convert angle in radian:

$$\text{Angle in radians} = \text{Angle in degrees} \times \pi/180^\circ = 45^\circ \times \pi/180^\circ = \pi/4$$

From (1),

$$\text{Radius} = (\text{length arc})/\text{Central angle}$$

$$= 33/(\pi/4)$$

$$= 132 \times 7/22 = 42$$

Therefore radius is 42 cm.
